# 1. INTRODUCTION

## 1.1 Versions and revisions

Episode design is an iterative process that typically involves multiple stakeholders. Once the design is finalized and the episode implemented, experience with the new payment model may generate new insights. The insights can in turn be leveraged to modify and improve the initial episode design. To keep track of the version of an episode used at any given time, a versioning system consisting of three numbers is employed:

- The algorithm version reflects the version of the software code used to produce the outputs for a particular episode. It is indicated by a major and minor version number, e.g., a1.1. The major algorithm version does not reset. The minor algorithm version resets when the major algorithm version is incremented.
- The configuration version reflects the version of the parameter settings and medical codes used to produce the outputs for a particular episode. The configuration includes for example the dollar amounts for the gain/risk sharing thresholds and the trigger diagnosis codes. The configuration version is indicated by a two digit number, e.g., c01. It is specific to the design decisions made by the organization that is implementing an episode and it does not reset.
- The documentation version reflects the version of the Detailed Business Requirements describing a particular episode. It is indicated by a two digit number, e.g., d01, and increments when a revision is made to the documentation without making a change to the algorithm or the configuration. It resets every time the algorithm or the configuration version changes.

Version	Date	Changes
<b>a1.0 c01 d01</b>	02/14/2014	<ul style="list-style-type: none"> <li>■ Initial design based on Clinical Advisory Group recommendations</li> </ul>
<b>a1.1 c02 d01</b>	06/30/2014	<ul style="list-style-type: none"> <li>■ Design based on episode customization decisions by Ohio Medicaid</li> </ul>
<b>a1.2 c03 d01</b>	07/28/2014	<ul style="list-style-type: none"> <li>■ Configuration and DBR: Added risk factors, risk coefficients, and high outlier values (Congenital hip and knee deformities and dislocations, heart failure)</li> <li>■ Configuration and DBR: Changed name to incomplete episode exclusion instead of low outlier</li> <li>■ Configuration and DBR: Removal of readmissions by procedure in the post trigger 2 window to simplify algorithm (no impact on spend). Readmissions in the post-trigger window 2 are now only by diagnosis code.</li> <li>■ Configuration and DBR: Added missing revenue codes for QM01 – 30 day hospitalization rate. Also, specified that only hospitalizations that are included in the spend should be considered for this metric.</li> <li>■ Configuration and DBR: Removed two CPT codes for chest x-rays from the pre-trigger window inclusion list (71010, 71020) and added 1 missing CPT code in the post-trigger inclusion list for Knee X-ray (73562)</li> <li>■ DBR: Moved multiple payer exclusion to main sections from glossary and updated definition to only use enrollment dates, not whether FFS and MCP claims are assigned to an episode</li> <li>■ DBR: Updated FQHC and RHC exception to TPL episode exclusion to only apply to FFS claims for MCP enrollees, not all FQHC and RHC claims</li> <li>■ DBR: Added Facility Claim ID and Facility Claim type and updated the Trigger Claim ID to be the triggering professional claim</li> <li>■ DBR Removed the mention of pharmacy inclusions in section 4.3.3 as medications are not intended to be included in the pre-trigger window</li> </ul>
<b>a1.2 c03 d02</b>	07/29/2014	<ul style="list-style-type: none"> <li>■ DBR: Corrected invalid reference to the Perinatal episode</li> <li>■ DBR: Updated version in the version table to 1.2 (instead of 1.1)</li> </ul>

a1.3 c04 d01	11/06/2014	<ul style="list-style-type: none"> <li data-bbox="690 321 1386 485">■ Configuration and DBR: Updated the configuration file to remove an unrelated diagnosis code from QM04 Blood Transfusions. This was the only Dx code and therefore the algorithm was updated to remove the requirement to search for Dx codes when assessing this QM (sections 2.3.7 and 4.7)</li> <li data-bbox="690 510 1386 569">■ Configuration: Updated the list of codes related to the Inconsistent Enrollment exclusion</li> </ul> <p data-bbox="735 642 889 667"><b>Clarifications</b></p> <ul style="list-style-type: none"> <li data-bbox="690 699 1386 758">■ DBR: Updated section 2.3.8 to clarify that payers are not expected to run their own risk adjustment process</li> <li data-bbox="690 783 1386 884">■ DBR: Updated section 3.1 to clarify that payers should use the historical data from FFS and other MCPs that they are provided when a member enrolls</li> <li data-bbox="690 909 1386 1010">■ DBR: Updated section 4.2 Exhibit 6 to align the dates with the appropriate window duration formula in the glossary. Formula is the last date minus the first date plus one (1)</li> <li data-bbox="690 1035 1386 1094">■ DBR: Update section 4.2 to clarify that long-term care claims are not assigned to hospitalizations</li> <li data-bbox="690 1119 1386 1220">■ DBR: Updated section 4.6 to clarify that TPL, long-term care, and long hospitalization exclusions are not dependent on claims being included in episode spend</li> <li data-bbox="690 1245 1386 1304">■ DBR: Updated glossary with Ohio Department of Medicaid definition of long-term care claims.</li> <li data-bbox="690 1329 1386 1430">■ DBR: Updated glossary to clarify that the member age calculation is based on the patient age at the start of the trigger window (and not episode window)</li> <li data-bbox="690 1455 1386 1514">■ Configuration: Updated configuration file to include dated change log</li> </ul>

Version	Date	Changes
a1.4 c05 d01	08/31/2015	<ul style="list-style-type: none"> <li data-bbox="690 317 1395 583">■ Configuration and DBR: Revised section 4.1 to reflect that anesthesia modifier codes are now used as well as assistant surgeon and discontinued surgery codes to identify non relevant claims. In the configuration file, added anesthesiologist procedure modifier codes to the code list, “Modifiers - Assistant Surgeons and Discontinued Surgery” and renamed the list “Modifiers - Assistant Surgeons, Anesthesiologists, and Discontinued Surgery”</li> <li data-bbox="690 611 1395 842">■ Configuration and DBR: Added note indicating only first digit of aid categories should be used to match against the provided code list in section 4.6. In the configuration, updated aid categories used to identify full Medicaid enrollment and dual eligibility. Aid category code lists now only contain the first digit of the aid category, as it is the only part of the code relevant for the purposes of episode based payment</li> <li data-bbox="690 869 1395 1100">■ Configuration and DBR: Added a transportation cost exclusion to the algorithm to avoid the unintentional inclusion of transport spend and better align with the intentions of the clinical advisory groups. The changes in algorithm logic are reflected in sections 2.3.3 and 4.3. The transportation HCPCS codes to facilitate a new transportation cost exclusion are in the configuration file</li> <li data-bbox="690 1127 1395 1253">■ Configuration: Aligned the configuration file with the DBR to indicate that relevant claims for quality metric 02 may occur in either post trigger window 1 or post trigger window 2, but not during the trigger window</li> <li data-bbox="690 1281 1395 1344">■ Configuration: Aligned HIV and obesity diagnosis codes across episodes</li> <li data-bbox="690 1371 1395 1434">■ DBR: Updated sections 2.3.9 and 4.9 for clarity and to align with currently proposed approach to gain/risk sharing</li> <li data-bbox="690 1461 1395 1587">■ DBR: Changed the long-term care exclusion, defined in sections 2.3.6 and 4.6, to exclude any episode where a long-term care is provided after the start of the episode and before the last day of the trigger window</li> <li data-bbox="690 1614 1395 1709">■ DBR: Added long-term care claim detail lines to the list of claims included during the trigger window in both sections 2.3.3 and 4.3</li> <li data-bbox="690 1736 1395 1799">■ DBR: Added the field output ‘PAP Name’ to the episode output table and revised section 4.5 accordingly</li> </ul> <p data-bbox="737 1860 899 1892"><b>Clarifications:</b></p>

Version	Date	Changes
		<ul style="list-style-type: none"> <li data-bbox="690 310 1390 443">■ Configuration and DBR: Added code list “Business Exclusions – PAP Out Of State” to explicitly indicate valid PAP locations (‘OH’) and updated the PAP out of State exclusion in section 4.6 accordingly</li> <li data-bbox="690 468 1390 600">■ Configuration: Updated code list names for “Clinical Exclusions – Death” and “Clinical Exclusions – Left Against Medical Advice” to match the DBR in correctly identifying these exclusions as clinical rather than business</li> <li data-bbox="690 625 1390 758">■ DBR: Updated section 4.2 to emphasize that the input data precedes the reporting period by 15 months, so potential triggers may not trigger episodes due to overlap with episodes that end prior to the current reporting period</li> <li data-bbox="690 783 1390 915">■ DBR: Updated section 3.1 to clarify that payers should only report on episodes where they paid the triggering claim. Episodes triggered off historical data should still be generated to test for overlap, but should not generate reports</li> <li data-bbox="690 940 1390 1005">■ DBR: Updated section 4.1 to clarify that claim types are defined in the glossary</li> <li data-bbox="690 1031 1390 1163">■ DBR: Made multiple small clarifying edits and updates throughout the document, including using only “episode window” when referring to the specific duration of an episode</li> <li data-bbox="690 1188 1390 1320">■ DBR: Updated the glossary to clarify that the <i>Header From Date Of Service</i> of a hospitalization is the start of that hospitalization and the <i>Discharge Date</i> of a hospitalization is the end of that hospitalization</li> <li data-bbox="690 1346 1390 1402">■ DBR: Updated section 2.3.2 to consistently refer to ‘trigger window’ instead of ‘potential trigger’</li> </ul>
<b>a1.4 c06 d01</b>	5/9/2016	<ul style="list-style-type: none"> <li data-bbox="690 1430 1390 1528">■ Configuration: Updated code sheet to include ICD-10 diagnosis and procedure codes in all appropriate sub-dimensions</li> <li data-bbox="690 1554 1390 1652">■ Configuration: Removed ICD-9 Dx codes pertaining to traumatic amputations and to the upper body from the included diagnosis sub-dimension</li> <li data-bbox="690 1677 1390 1734">■ DBR: Updated section 3.3 to state that incomplete codes listed in the code sheet should not be expanded</li> </ul>

Version	Date	Changes
a1.5 c07 d01	12/20/2016	<ul style="list-style-type: none"> <li data-bbox="690 317 1395 516">■ Configuration and DBR: Added an exclusion for episodes where the PAP is a federally qualified health center or rural health clinic. The changes in algorithm logic are reflected in sections 2.3.6, 3.4.1, and 4.6. The codes used to identify FQHC/RHCs are listed in the configuration file under ‘Business Exclusions – FQHC and RHC’</li> <li data-bbox="690 537 1395 632">■ Configuration and DBR: Renamed the list ‘Business Exclusions – TPL FQHC And RHC’ to ‘Business Exclusions – TPL Exempt Places of Service’</li> <li data-bbox="690 653 1395 789">■ DBR: Updated definition of the Multiple payers exclusion to only exclude episodes where a patient changes enrollment between MCPs, not between FFS and an MCP. The changes in algorithm logic are reflected in sections 2.3.6 and 4.6</li> </ul>
a1.5 c08 d01	12/1/2017	<ul style="list-style-type: none"> <li data-bbox="690 821 1395 989">■ Configuration: Changed the time period for the list Included Procedures to During Pre-trigger, Post-trigger 1, and Post-trigger 2 Windows. Changed the time period During Post-trigger 1 Window and Post-Trigger window 2 to During Post-trigger 1 and Post-trigger 2 Windows, wherever applicable.</li> <li data-bbox="690 1010 1395 1073">■ Configuration and DBR: Updated the naming convention for risk factor lists to improve consistency across episodes</li> <li data-bbox="690 1094 1395 1230">■ Configuration and DBR: Updated all ICD-9 code references to also specify ICD-10. Renamed references to ‘ICD-9 Px’ in list names with ‘Surgical Procedures’. Added an entry for ‘ICD-10’ in the Glossary</li> <li data-bbox="690 1251 1395 1388">■ DBR: Added the field 'HIC3 Code' to the input data in section 3.1 and revised section 4 accordingly to indicate that HIC3 codes should be pulled directly from claims rather than being cross-walked from the input field 'National Drug Code'.</li> <li data-bbox="690 1409 1395 1472">■ DBR: Added the field 'Billing Provider Specialty' to the input data in section 3.1.</li> <li data-bbox="690 1493 1395 1598">■ DBR: Updated section 4.1 to specify that preliminary potential trigger start and end dates can be extended if they overlap with another hospitalization.</li> <li data-bbox="690 1619 1395 1755">■ DBR: Updated section 4.1 to change the timing requirement for associated inpatient claims. Inpatient claims must fully overlap relevant detail lines of the professional trigger claim to be considered for selection as an associated facility claim</li> <li data-bbox="690 1776 1395 1873">■ DBR: Updated section 4.1 to indicate that, when an outpatient claim with a confirming procedure code is selected to be an associated facility claim, only the claim detail lines containing</li> </ul>

Version	Date	Changes
		<p>a confirming procedure code are eligible to be factored into the potential trigger duration logic.</p> <ul style="list-style-type: none"> <li>■ DBR: Updated section 4.2 to specify that the pre-trigger window can be extended if it overlaps with another hospitalization.</li> <li>■ DBR: Updated section 4.2 to specify that the TJR episode has a clean period of 180 days.</li> <li>■ DBR: Updated the definition of ‘Hospitalization’ in the Glossary to indicate that the Header To Date of Service field of the first inpatient claim should be used when its Discharge Date of the claim is not populated</li> <li>■ DBR: Updated the Glossary to expand the definition the Pharmacy claims to include both claim types P and Q.</li> </ul> <p><b>Clarifications:</b></p> <ul style="list-style-type: none"> <li>■ DBR: Updated the Source Table Name of the input field 'MCP ID' to specify that the T_CA_ICN.MCO_PROV_KEY should also be used.</li> <li>■ DBR: Updated section 4.1 to improve consistency of language across episodes.</li> <li>■ DBR: Updated section 4.2 to clarify that overlap between episode windows is not allowed.</li> <li>■ DBR: Updated section 4.2 to clarify that assignment to the pre-trigger window takes precedence when a claim spans both pre-trigger and post-trigger windows.</li> <li>■ DBR: Updated section 4.4 to clarify that a separate methodology is applied to estimate the spend for inpatient, header-paid encounters.</li> <li>■ DBR: Updated section 4.6 to clarify that the Multiple payers exclusion is looking for switches at the payer name-level, not the MCP ID-level. This is required because a payer may be associated with multiple MCP IDs</li> </ul>

## 1.2 Scope of this document

The Detailed Business Requirements (DBR) document serves as a guide to understand the definition of an episode. The DBR addresses three audiences:

- The episode owner who is accountable overall for the episode design and implementation
- The analytics team tasked with pressure testing the design of an episode and quality controlling the outputs from the episode algorithm
- The IT team tasked with implementing the algorithm to produce outputs for an episode

Section 2 of the DBR contains the description of an episode and is aimed at the episode owner and the analytics team. It addresses the following questions:

- **Patient journey:** Which patient cases are addressed by the episode?
- **Sources of value:** At which points in the patient journey do providers have most potential to improve quality of care and outcomes?
- **Design dimensions:** What decisions underlie the design of the episode?
  - Trigger: Which events trigger an episode?
  - Episode duration: What is the duration of the episode?
  - Claims included and excluded: Which claims are included in or excluded from the episode spend?
  - Episode spend: How is the spend for an episode calculated?
  - Principal Accountable Provider (PAP): Which provider is primarily held accountable for the outcomes of an episode?
  - Episode exclusions: Which episodes are excluded from a PAP’s average episode spend for the purposes of calculating any gain/risk sharing?
  - Quality metrics: Which quality metrics are employed to inform PAPs about their quality of care?
  - Risk adjustment: What approach is taken to adjust episodes for risk factors that cannot be directly influenced by the PAP?
  - Gain and risk sharing: How are the gain and risk sharing amounts for PAPs determined?

Section 3 of the DBR explains the data flow of an episode. It is aimed at the analytics team and the IT team and addresses the following questions:

- **Input data:** What inputs does the episode algorithm require to build the episode?

- **Episode algorithm:** What is the intent of the episode design that needs to be reflected in the software code to produce the episode outputs?
- **Episode configuration:** What parameters (e.g., dollar amounts) and medical codes (e.g., diagnosis codes) need to be specified to define the episode?
- **Outputs:** What are the outputs of an episode algorithm?
- **Provider reports:** What information is included in the provider reports?

The algorithm logic in section 4 of the DBR is aimed at the IT team. It may also be helpful to the analytics team in their communication with the IT team over the course of quality controlling an episode. The algorithm logic addresses the following questions:

- What are the logical steps the episode algorithm needs to complete in order to produce the required outputs?
- Which cases does the algorithm need to address?
- Are there exceptions to the overall logic and if so, how are they handled?

The DBR document does not cover the following topics:

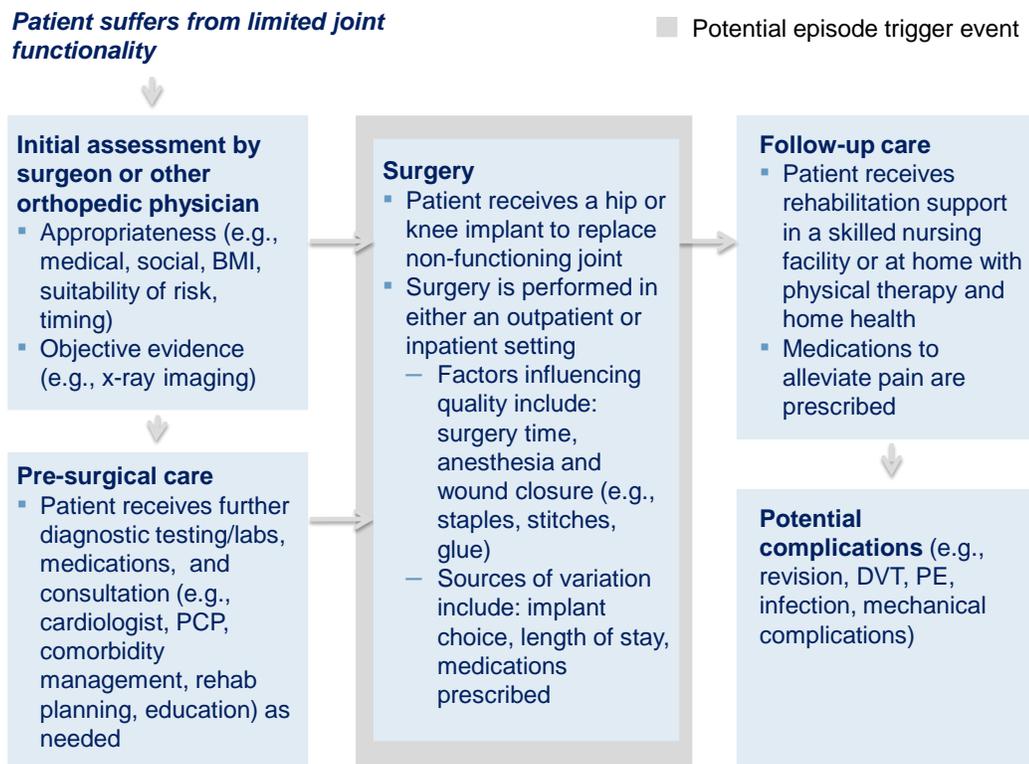

- Background on how episodes compare to the current payment system
- Clinical rationale for inclusions and exclusions
- Intermediate analyses used during design of the episode
- Meeting materials used during design of the episode
- Guidance on data collection/transformation/storage
- Guidance on the episode algorithm coding approach

## 2. DESCRIPTION OF THE EPISODE

### 2.1 Patient journey

The episode described in this document pertains to patients who undergo either a total joint hip replacement procedure or a total joint knee replacement procedure. Leading up to the surgery, the patient may undergo physical exams and diagnostic imaging tests to prepare them for the surgery. The patient may also see a consulting provider. The total joint replacement procedure can take place in either an inpatient or outpatient setting. Following the surgery, the patient may recover in an acute inpatient facility or a skilled nursing home. Alternatively, the patient may receive rehabilitative care and/or physical therapy at home or at a designated facility.

#### EXHIBIT 1 – PATIENT JOURNEY

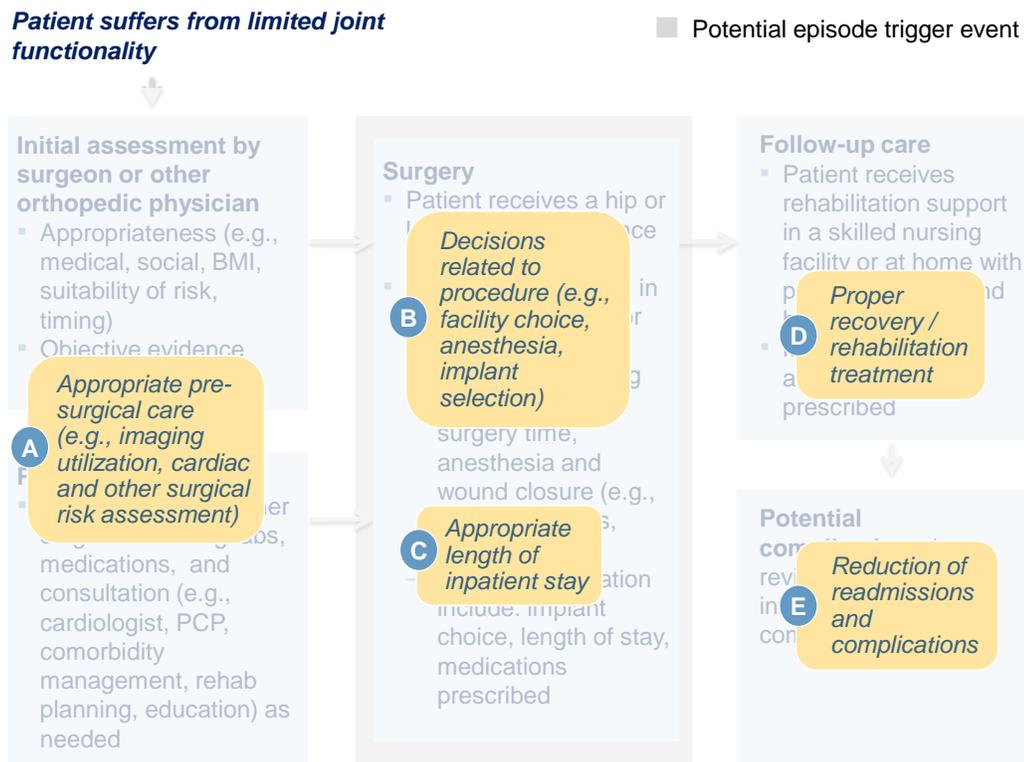

## 2.2 Sources of value

In delivering care to a TJR patient, providers have several opportunities to improve the quality and cost of care and to reduce clinical variation (Exhibit 2). They can, for example, try to reduce the number of unnecessary services such as duplicates of diagnostic imaging during the initial assessment of the patient.

The provider can also influence the use of more cost efficient facilities for the surgery and the length of a potential inpatient stay. During the surgery, the provider's choice of surgical technique, implant and wound closure (e.g., staples, stitches, glue) are important sources of value.

Furthermore, the provider can minimize the likelihood of complications and readmissions by ensuring appropriate recovery and rehabilitation practices. This includes pain management for an appropriate duration of time following the surgery.

EXHIBIT 2 – SOURCES OF VALUE

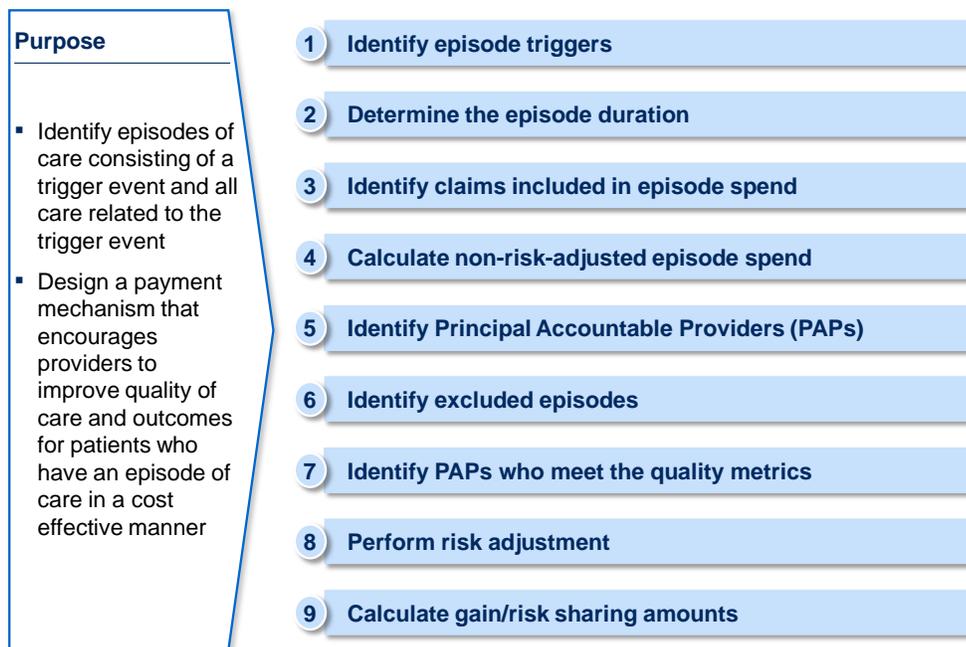

## 2.3 Design dimensions

Designing and building a TJR episode comprises nine dimensions, as depicted in Exhibit 3. Each dimension is associated with a set of data manipulations that convert the data inputs to the desired data outputs. Section 3 provides additional details on the episode data flow.

### EXHIBIT 3 – EPISODE DESIGN DIMENSIONS

---

---

### 2.3.1 Episode trigger

A potential trigger for TJR episode is a TJR procedure. Potential triggers are identified based on a professional claim with a procedure code denoting a total hip replacement or a total knee replacement. The professional claim must be associated with an inpatient or an outpatient claim with a TJR procedure and without a disqualifying diagnosis code.

If a patient is transferred from one inpatient facility to a second inpatient facility or remained a patient across consecutive inpatient claims, the claims from all the inpatient facilities are treated as a single hospitalization. See the glossary for a detailed definition of hospitalization. If an associated inpatient claim is part of hospitalization, the potential trigger starts at the beginning of the earliest inpatient claim in the hospitalization and ends at the end of the last inpatient claim of the hospitalization.

The configuration file lists the trigger procedure codes and disqualifying diagnosis codes under “Trigger Procedure Codes” and “Trigger Disqualifying Diagnosis Codes”. Hospitalizations and the claim types referenced throughout the DBR are defined in the glossary.

Potential triggers are categorized as hip replacements or knee replacements based on the procedure code on the professional claim.

A professional claim with a TJR procedure code but without an associated hospitalization or outpatient claim with a TJR procedure code does not constitute a potential trigger and vice versa.

### 2.3.2 Episode duration

The duration of the TJR episode comprises the pre-trigger window, the trigger window, and the post-trigger window. Overall, the duration of an episode is referred as the episode window.

- **Pre-trigger window:** The pre-trigger window begins 90 days before the start the trigger window and ends one day before the start of the trigger window.
- **Trigger window:** The trigger window begins on the first day of a potential trigger and ends on the last day of a potential trigger that starts an episode.
- **Post-trigger window:** The post-trigger window begins the day after the trigger window ends and extends for 90 days, inclusive. The post-trigger window consists of two phases:
  - Post-trigger window 1: The post-trigger window 1 begins the day after the trigger window ends and extends for 30 days, inclusive.
  - Post-trigger window 2: The post-trigger window 2 begins the day after the post-trigger window 1 ends and extends for 60 days, inclusive.

If a hospitalization begins on or prior to the 30<sup>th</sup> day of the post-trigger window 1 and extends beyond the 30<sup>th</sup> day (i.e., is ongoing on the 30<sup>th</sup> day of the post-trigger window 1), then the post-trigger window 1 is extended until discharge from the hospitalization. Since the post-trigger window 2 begins on the day after the post-trigger window 1, an extension of the post-trigger window 1 leads to a decrease in the length of the post-trigger window 2.

The same extension of a window can occur for the post-trigger window 2. If a hospitalization begins on or prior to the 90<sup>th</sup> day after the end of the trigger window and extends beyond the 90<sup>th</sup> day, the post-trigger window 2 is extended until discharge from the hospitalization. If a hospitalization extends the post-trigger window 1 beyond the 90<sup>th</sup> day after the end of the trigger window, the episode does not have a post-trigger window 2. Extending the episode in this way may only occur once per window and does not lead to further extensions.

Based on the definitions of the pre-trigger, trigger, post-trigger window 1 and post-trigger window 2, potential triggers are divided into trigger TJRs and repeat TJRs:

- **Trigger TJRs:** Potential triggers that do not occur with 180 days of another potential trigger and therefore constitute the trigger window of a new episode.
- **Repeat TJRs:** Potential triggers that occur within 180 days of each other. Neither of the two potential triggers starts an episode. Repeat TJRs can occur because of bilateral surgeries or a hip and knee replacement for the same patient occurring within 180 days.

### 2.3.3 Claims included in episode spend

Episode spend is calculated on the basis of claims directly related to or stemming from the TJR. Claims that are included in the calculation of episode spend are referred to as included claims. Claims that are not included in the calculation of episode spend are referred to as excluded claims. The criteria to identify included claims depend on the time window during which a claim occurs.

- **Pre-trigger window:** Outpatient and professional claim detail lines with an included procedure code for radiology, laboratory services, or select pre-

surgery tests are included claims. Hospitalizations during the pre-trigger window and any outpatient, professional, and pharmacy claims that occur during the hospitalizations are excluded claims. To capture bundled outpatient procedures, all claim detail lines on the same outpatient claim that have the same service start date and service end date as the claim detail line with an included procedure are also included claim detail lines.

- **Trigger window:** All inpatient, outpatient, long-term care, professional, and pharmacy claims during the trigger window are included claims.
- **Post-trigger window:** Inpatient, outpatient, long-term care, professional, and pharmacy claims during the post-trigger window that are related to the TJR or indicate potential complications are included claims. Included claims during the post-trigger window fall into five, hierarchical groups:
  - Included hospitalizations in the post-trigger window 1: Hospitalizations are included in the calculation of episode spend unless the reason for the hospitalization was unrelated to the episode. Hospitalizations that are unrelated to the episode are identified using excluded APR-DRGs (for header-paid inpatient claims) or, for detail-paid inpatient claims, the absence of an included diagnosis code in any diagnosis field. The excluded APR-DRGs were derived from the readmission exclusion MS-DRGs used by the Centers for Medicare and Medicaid Services for the Bundled Payments for Care Improvement (BPCI) Initiative. All inpatient claims that are part of an included hospitalization are included claims. Any pharmacy, outpatient, and professional claims that occur during an included hospitalization are included claims. Any pharmacy, outpatient, and professional claims that occur during an excluded hospitalization are excluded claims.
  - Included hospitalizations in the post-trigger window 2: Hospitalizations are included in the calculation of episode spend if they contain an included diagnosis code in any diagnosis field. All inpatient claims that are part of an included hospitalization are included claims. Any outpatient and professional claim detail lines and any pharmacy claims that occur during an included hospitalization are included claim detail lines. Any pharmacy, outpatient, and professional claims that occur during an excluded hospitalization are excluded claims.

- Included diagnoses: Outpatient, professional and long-term care claims with an included diagnosis code that do not occur during a hospitalization are included claims.
- Included procedures: Outpatient, professional, and long-term care claims with an included procedure code that do not occur during a hospitalization are included claims.
- Included medications: Pharmacy claims with an included medication code and that do not occur during a hospitalization are included claims.

The one exception to the above logic are claims related to transportation, which are always excluded claims no matter when they occur.

The codes used to identify excluded APR-DRG as well as included diagnoses, included procedures, included medications, and excluded transportation are listed in the configuration file under “Excluded APR-DRG”, “Included Diagnoses”, “Included Procedures”, “Included Medications”, and “Excluded Transportation”.

#### 2.3.4 Episode spend

The episode spend is the amount that reflects the totality of spend for included claims. Since the totality of spend for included claims is not yet risk-adjusted, it is referred to as non-risk-adjusted episode spend. Based on the available data, Ohio Medicaid calculates the non-risk-adjusted episode spend as the sum of the allowed amount for included claims from Medicaid Fee For Service and the sum of the paid amount for included claims from Medicaid Managed Care Plans (MCPs). Given variation in data and payment practices, payers should use their judgment in determining which fields to utilize so as to best reflect the entire spend of an episode.

To remove variation in inpatient spend that is intentionally not addressed by the episode-based payment model, spend for included, DRG-paid inpatient claims is calculated by summing the APR-DRG base payment and the APR-DRG outlier payment for each included, DRG-paid inpatient claim. Medical education and capital expenditure payments are not included in non-risk-adjusted episode spend.

The non-risk-adjusted episode spend is calculated overall and by claim type, by window during the episode, and by claim type and window during the episode.

For the purpose of risk-adjustment only, a separate measure of episode spend, referred to as normalized-non-risk-adjusted episode spend, is used. Normalized-non-risk-adjusted episode spend is calculated using normalized APR-DRG base rates for DRG-paid inpatient claims to remove variation in unit prices before performing risk adjustment. DRG-exempt inpatient, outpatient, long-term care, professional, and pharmacy spend is calculated the same way for normalized-non-risk-adjusted episode spend as for non-risk-adjusted episode spend.

To calculate the DRG-paid inpatient spend component of normalized-non-risk-adjusted episode spend the APR-DRG base payment for each included DRG-paid inpatient claim is normalized using the following method: The normalized base rate is calculated as the average hospital base rate across all DRG-paid inpatient claims weighted by volume of DRG-paid inpatient claims. The DRG base payment on each DRG-paid inpatient claim is then multiplied by the ratio of the normalized base rate to the actual base rate of each hospital. Outlier payments, if present, are added unchanged. The medical education payment and the capital expenditure payment are not included in normalized-non-risk-adjusted episode spend.

### 2.3.5 Principal Accountable Provider

The Principal Accountable Provider (PAP) is the provider deemed to be in the best position to influence the quality and cost of care for a patient receiving a TJR. The PAP is the physician entity performing the TJR. The PAP is identified using the billing provider ID on the professional claim with the total hip or total knee replacement procedure during the trigger window.

### 2.3.6 Excluded episodes

Episode exclusions ensure that the remaining episodes are comparable to each other and allow fair comparisons between patient panels. After all exclusions that identify invalid episodes been applied, a set of valid episodes remains. The valid episodes form the basis to assess the performance of PAPs.

#### ■ **Business exclusions:**

- **Inconsistent enrollment:** An episode is excluded if there are gaps in full Medicaid coverage (FFS or with an MCP) of the patient during the episode window.

- Multiple payers: An episode is excluded if a patient changes enrollment between MCPs during the trigger window or the post-trigger window(s) (if applicable). The rules to attribute an episode to a payer are described in the glossary under “Payer Attribution.”
- Third-party liability: An episode is excluded if third-party liability charges are present on any claim or claim detail line during the episode window or if the patient had relevant third-party coverage at any time during the episode window.
- Duals: An episode is excluded if a patient has dual coverage by Medicaid and Medicare at any time during the episode window.
- PAP out of state: An episode is excluded if the PAP’s practice address is outside Ohio.
- No PAP: An episode is excluded if the billing provider ID is not available.
- Long hospitalization: An episode is excluded if a hospitalization longer than (>) 30 days occurs during the episode window.
- Long-term care: An episode is excluded if the patient lives in a long-term care facility as identified by long-term care claims occurring during pre-trigger or trigger window, with the exception of claims starting the last day of the trigger window.
- Missing APR-DRG: An episode is excluded if a DRG-paid inpatient claim during the episode is missing the APR-DRG and severity of illness.
- Incomplete episodes: An episode is excluded if the non-risk-adjusted episode spend (not the risk-adjusted episode spend) is less than the incomplete episode threshold. Spend less than the incomplete episode threshold may be an indication that claims are miscoded or incomplete. The incomplete episode threshold was set at the cost of the minimum services required to treat an episode. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episode”.
- FQHC/RHC: An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. The configuration file lists the codes used to identify FQHCs and RHCs under “Business Exclusions – FQHC and RHC.”

■ **Clinical exclusions:**

- Age: An episode is excluded if the patient is older than sixty four (> 64) years of age.
- Left Against Medical Advice: An episode is excluded if a patient has a discharge status of “left against medical advice or discontinued care” on any inpatient or outpatient claim during the episode window.
- Death: An episode is excluded if the patient has a discharge status of “expired” on any inpatient or outpatient claim during the episode window or has a date of death prior to the end of the episode window.
- Comorbidity: An episode is excluded if the patient has one or more of the following comorbidities during the specified time window. The configuration file lists the comorbidity codes and time windows under “Comorbidities <comorbidity name>”. Comorbidity codes are searched for on inpatient, outpatient, long-term care and professional claims. The comorbidities are:
  - End stage renal disease (ESRD) during the episode window or during the 365 days before the episode window
  - Human immunodeficiency virus (HIV) infection during the episode window or during the 365 days before the episode window
  - Sickle cell disease during the episode window or during the 365 days before the episode window
  - Lower leg fracture, dislocations or open wounds during the 365 days before the episode window and during the pre-trigger window.
  - Congenital hip and knee deformities and dislocations during the episode window or during the 365 days before the episode window
  - Heart failure during the episode window or during the 365 days before the episode window
- Multiple other comorbidities: An episode is excluded if it is affected by too many risk factors to reliably risk adjust the episode spend. This exclusion is not applicable for the TJR episode.

■ **Outliers:**

- High outlier: An episode is excluded if the risk-adjusted episode spend (not the non-risk-adjusted episode spend) is greater than the high outlier threshold. The high outlier threshold was set based on analyses of episode spend distributions for episodes that ended between June 2012 and May

2013, inclusive. It was set at three standard deviations above the average risk-adjusted episode spend for otherwise valid episodes. The high outlier threshold is listed as a parameter in the configuration file under “High Outlier”.

### 2.3.7 Quality metrics

A PAP must pass all quality metrics tied to gain sharing to be eligible for gain sharing. In addition, PAPs receive information on additional quality metrics that allow them to assess their performance, but do not affect their eligibility to participate in gain sharing. Quality metrics are calculated for each individual PAP across valid episodes attributed to that PAP. The quality metrics are based on information contained in the claims filed during an episode. Additional information on how the quality metrics could be tied to gain sharing is provided in section 2.3.9 (“Gain and risk sharing”).

#### ■ **Quality metrics tied to gain sharing:**

- Quality metric 1: Percent of valid episodes where the patient has one or more included hospitalizations during the post-trigger window 1, excluding hospitalizations that occur in an acute rehabilitation facility. The codes used to identify relevant claims and acute rehabilitation facilities are listed in the configuration file under “Quality metric 01 – Rehabilitation Diagnoses” and “Quality metric 01 – Rehabilitation Revenue Codes”.
- Quality metric 2: Percent of valid episodes where the patient has a fracture, dislocation or wound infection in the post-trigger window 1 or post-trigger window 2. The diagnosis and procedure codes used to identify relevant inpatient, outpatient, professional or long-term care claims are listed in the configuration file under “Quality metric 02 – Fractures, Dislocations, And Wound Infections Diagnoses/Procedures”.

#### ■ **Quality metrics not tied to gain sharing** (i.e., included for information only):

- Quality metric 3: Percent of valid episodes where the patient develops a Pulmonary Embolism (PE) in the trigger window, post-trigger window 1 or post-trigger window 2. The procedure codes used to identify relevant inpatient, outpatient, professional, and long-term care claims are listed in

the configuration file under “Quality metric 03 - Pulmonary Embolism Diagnoses”.

- Quality metric 4: Percent of valid episodes where the patient receives one or more blood transfusions during the trigger window. The procedure and revenue codes used to identify relevant inpatient, outpatient, and professional claims are listed in the configuration file under “Quality metric 04 – Transfusions Procedures/Revenue Codes”.

### 2.3.8 Risk adjustment

Principal Accountable Providers (PAPs) participating in episode-based payment models are compared based on their performance on quality metrics and based on the average spend for episodes treated by each PAP. The credibility and effectiveness of an episode-based payment model therefore rests on the comparability and fairness of the episode spend measure used in the comparisons. Risk adjustment is one of several mechanisms that episode-based payment models may use to achieve comparability in episode spend across PAPs.

Risk adjustment specifically captures the impact on episode spend of documented clinical risk factors that typically require additional care during an episode and are outside the control of the PAP. The goal of risk adjustment is to account for different levels of medical risk across patient panels and, by doing so, reduce incentives for tactical selection of patients (i.e., avoiding riskier and more costly patients) when payments are tied to episode spend performance.

Risk factors and risk coefficients are identified in an iterative process informed by medical best practice, expert opinion, and statistical testing. The risk coefficients are used to calculate a risk score for each episode given the risk factors that are present for the episode. The risk score represents the ratio of the expected episode spend when no risk factors are present to the expected episode spend given the set of risk factors present for the episode. Multiplying the observed episode spend by the risk score results in the risk-adjusted episode spend. Risk-adjusted episode spend represents how much spend would have been incurred during the episode had there been no risk factors present, all other things being equal. By minimizing the effect of clinically documented medical risk that is outside the control of the PAP on episode spend, risk-adjustment

contributes to the fairness of the episode spend comparisons that underlie episode-based payment models.

For additional details on the risk adjustment process, please refer to the document “Supporting documentation on episode risk adjustment”. This process was conducted as part of episode design by the Ohio Department of Medicaid. Risk factors and coefficients derived from this process are included in the accompanying configuration file. At this time, it is not expected that individual payers run their own risk adjustment process.

For TJR, the risk factors are:

- Anemia
- Congestive heart failure; non hypertensive
- Obesity
- Pulmonary heart disease
- Peripheral and visceral atherosclerosis
- Personality and Behavioral Disorders
- Cerebrovascular disease

Risk factors have to be present during the episode window or during the 365 days before the episode window. The risk coefficients associated with each risk factor are listed as parameters in the configuration file under “Risk Adjustment”.

### 2.3.9 Gain and risk sharing

The State of Ohio and the MCPs will send provider reports to PAPs to inform them about their performance in the episode-based payment model. A detailed description of the provider reports is beyond the scope of the Detailed Business Requirements. Please refer to the “Episode of Care Payment Report Sample” provided separately as a general guide for the layout and metrics of the provider reports.

At some point after thresholds are set, provider reports will include gain/risk sharing information. Gain/risk sharing is determined based on the comparison of the average risk-adjusted episode spend for valid episodes of each PAP to three pre-determined thresholds. The thresholds and relevant calculations are detailed below. Note that, throughout this section, the average risk-adjusted

episode spend for valid episodes will be referred to as the ‘average risk-adjusted spend’:

- **Acceptable threshold:** PAPs with an average risk-adjusted spend above the acceptable threshold and that also have a minimum of five valid episodes during the performance period owe a risk-sharing payment.
- **Commendable threshold:** PAPs with an average risk-adjusted spend between the commendable threshold and above the gain sharing limit threshold that also have a minimum of five valid episodes and pass the quality metrics tied to gain sharing during the performance period receive a gain sharing payment.
- **Gain sharing limit threshold:** PAPs with average risk-adjusted spend below the gain sharing limit threshold that also have a minimum of five valid episodes and pass the quality measures tied to gain sharing receive a gain sharing payment that is proportional to the difference between the commendable threshold and the gain sharing limit as a percentage of average risk-adjusted episode spend.

PAPs with average risk-adjusted episode spend between the acceptable and commendable thresholds may neither owe a risk sharing payment nor receive a gain sharing payment.

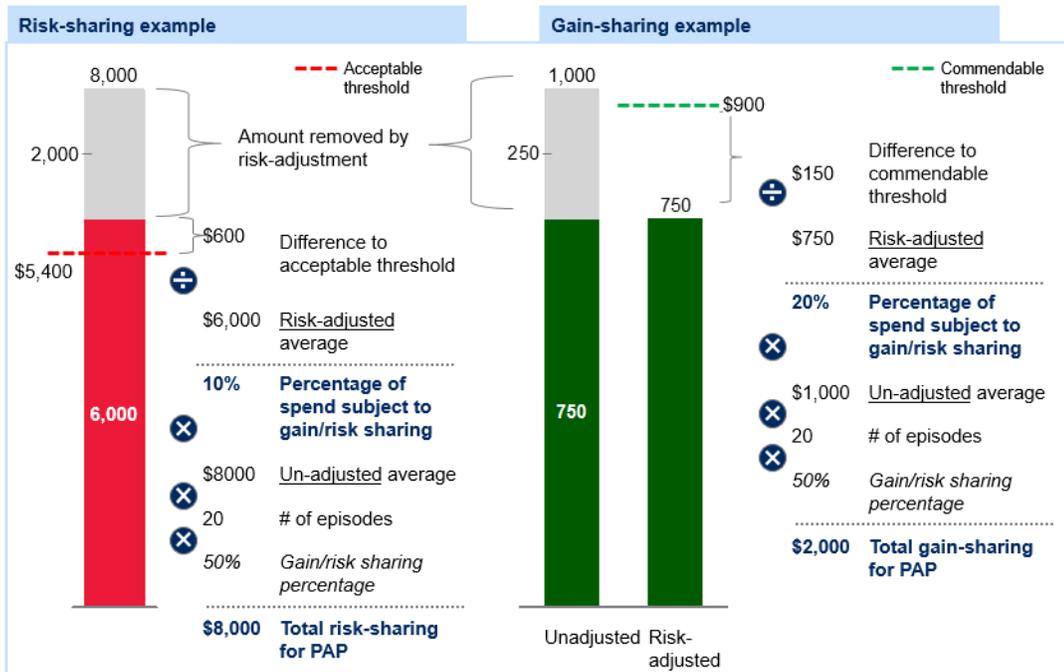

The gain or risk sharing payment of each PAP is calculated based on episodes that ended during a performance period of a certain length (e.g., 12 months). The calculation of the gain or risk sharing payment is as follows (Exhibit 4):

- **Risk sharing:** The calculation of the risk-sharing amount involves multiplying the percentage of spend subject to risk-sharing by the total non risk-adjusted episode spend for all valid episodes of the PAP and the risk-sharing proportion (e.g., 50%). The percentage of spend subject to risk-sharing is the difference between the PAP's risk-adjusted spend and the acceptable threshold as a percentage of the PAP's risk-adjusted spend.
- **Gain sharing:** The calculation of the gain-sharing amount involves multiplying the percentage of spend subject to gain sharing by both a PAP's total non risk-adjusted episode spend for valid episodes and the gain-sharing proportion (e.g., 50%). The calculation of the percentage of spend subject to gain sharing depends on whether the PAP's average risk-adjusted spend is above or below the gain-sharing limit:

- If a PAP's average risk-adjusted spend is above the gain sharing limit, the percentage of spend subject to gain-sharing is the difference between the PAP's average risk-adjusted spend and the commendable threshold as a percentage of the PAP's average risk-adjusted spend.
- If the PAP's average risk-adjusted spend is below the gain sharing limit, the percentage of spend subject to gain sharing is the difference between the gain sharing limit and the commendable threshold as a percentage of the PAP's average risk-adjusted spend.

EXHIBIT 4 – CALCULATION OF RISK- AND GAIN- SHARING PAYMENTS

ILLUSTRATIVE EXAMPLE

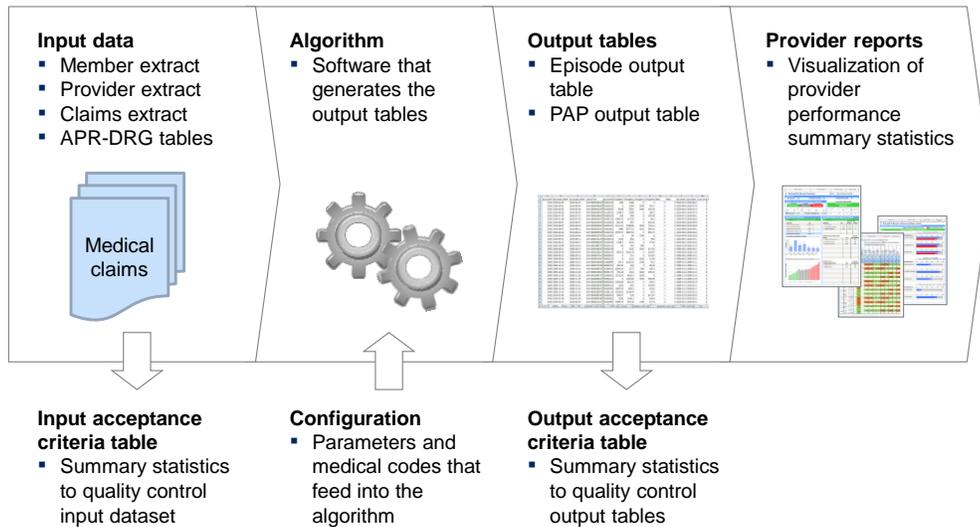

### 3. EPISODE DATA FLOW

The analytics underlying an episode-based payment model are performed by an episode algorithm. The algorithm takes an input dataset, transforms the data in accordance with the intent of the episode design, and produces a set of output tables (Exhibit 5). The output tables are used to create provider reports.

Several of the episode design dimensions require input parameters such as age ranges and medical codes such as diagnosis, procedure, and medication codes to specify the intent of the episode. The parameters and medical codes are provided in the episode configuration.

It is recommended that the episode data flow include two elements for quality assurance: (1) An input acceptance criteria table to assess the content and quality of the input dataset. (2) An output acceptance criteria table to assess the content and quality of the output tables. It is the responsibility of each payer to determine the details of appropriate quality assurance measures.

EXHIBIT 5 – EPISODE DATA FLOW

### 3.1 Input data

To build an episode, the following input data are needed:

- **Member Extract:** List of patients and their health insurance enrollment information.
- **Provider Extract:** List of participating providers and their addresses.
- **Claims Extract:** Institutional claims (UB-04 claim form), professional claims (CMS1500 claim form), and pharmacy claims (NCPDP claim form) at the patient level.
- **APR-DRG Base Rate Table:** Table containing the APR-DRG base rate for each DRG-paid provider.

The table below lists the required input fields using the source field abbreviations and source table names provided in the Ohio Vendor Extracts Companion Guides. The algorithm logic (section 4) describes the use of each input field. In the algorithm logic, input fields are referred to by the “Source field name in DBR” and written in italics.

**Table – Input fields**

<b>APR-DRG Base Rate Table</b>		
Provider ID	Medicaid Provider ID	APR DRG Base Rates to Plans.xlsx
Base Rate	Base Rate	APR DRG Base Rates to Plans.xlsx

The date range for the input data has to include the 12 months duration reporting period as well as the 15 months preceding the reporting period. The 15 months preceding the reporting period are needed to allow for identification of risk factors and comorbidities as well as to provide sufficient input data to identify the episode start date for the first episodes that end during the reporting period.

The input data includes claims from the payer responsible for the episode as well as historical claims from other Medicaid payers prior to the episode trigger.

Payers are provided with this claims data upon member enrollment. The inclusion of this data is particularly important in generating appropriate risk factors and exclusions.

Historical data should be treated exactly the same as claims that were submitted directly to the payer with one exception: Payers should only report on episodes for which they paid the triggering claim in order to avoid double-counting of episodes across plans.

The input data has to contain only unique and paid claims. It is the responsibility of each payer to apply appropriate methods to ensure that all claims in the input data are valid, de-duplicated, and paid. For Ohio Medicaid, the methods provided by the State are used to remove duplicate and void claims. The input fields *Header Paid Status* and *Detail Paid Status* are used to determine whether a claim or claim detail line was paid.

If the value of an input field from the Claims Extract that is required to build an episode is missing or invalid, then the corresponding claim is ignored when building the episode. For example, a claim that would be a potential trigger, but is missing the *Header From Date Of Service*, cannot be a potential trigger.

### 3.2 Episode algorithm

The intent of the episode algorithm is detailed in the algorithm logic (section 4) of the DBR.

### 3.3 Episode configuration

The parameters and medical codes needed to define an episode are listed in the configuration file which is provided as an attachment to the DBR. The file includes:

- **Parameters sheet:** Values for parameters used in the episode, for example the outlier thresholds and risk coefficients
- **Code sheet:** Medical codes used in the episode, for example trigger diagnosis or procedure codes and codes to identify included claims. Diagnosis and procedure codes may be provided as complete or incomplete codes.

The algorithm logic (section 4) explains the intended use of the parameters and medical codes by the episode algorithm. References to medical codes in the configuration file are made using the name for the relevant design dimension subcategory in the code sheet of the configuration file. References to parameters in the configuration file are made using the name for the relevant design dimension in the parameters sheet of the configuration file.

### 3.4 Output tables

Using the input data tables and the configuration file, an episode algorithm creates two output tables: the episode output table and the PAP output table. The algorithm logic (section 4) describes the definition of each output field. In the algorithm logic, output fields are referred to by the output field names provided in the tables below and are written in italics.

#### 3.4.1 Episode output table

The episode output table contains the set of episodes identified by the algorithm and the characteristics of each episode. The table below lists the required output fields.

**Table – Episode Output Table**

Output field name	Output field abbreviation
<b>Episode identification</b>	
Trigger Claim ID	TriggerClaimID
Trigger Claim Type	TriggerClaimType
Facility Claim ID	FacilityClaimID
Trigger Claim Type	FacilityClaimType

Number of QM depends on episode	

### 3.5 Provider reports

During the initial implementation phase, each PAP receives a report to inform them about their performance in the episode-based payment model. The information shown in the provider report is based on the episode and PAP output tables. The reports show episodes with an episode end date during the reporting period. A detailed description of the provider report is beyond the scope of the DBR. Please refer to the “Episode of Care Payment Report Sample” provided separately as a general guide for the layout and metrics of the provider report.

## 4. ALGORITHM LOGIC

The algorithm logic forms the basis to code an episode algorithm. It explains the intent of the episode design at a level of granularity that will allow an IT implementation team to create an algorithm that matches the episode design.

### 4.1 Identify episode triggers

The first design dimension of building a TJR episode is to identify potential triggers.

**Episode output fields created:** *Trigger Claim ID, Member ID, Facility Claim ID, Facility Claim Type, Hip Indicator*

Potential triggers are identified over the entire date range of the input data. For the TJR episode, a potential trigger is defined as a professional claim with a procedure code for a TJR, as well as an associated facility claim. Hospitalizations consist of one or more inpatient claims and are defined in the glossary. Claim types (inpatient, outpatient, long-term care, professional, and pharmacy) are identified based on the input field *Claim Type*. For the definition of each claim type see the glossary.

The professional claim must meet all of the following conditions:

- The claim has a procedure code for a TJR in the input field *Detail Procedure Code* of one or more of its claim detail lines. The configuration file lists the TJR procedure codes under “Trigger Procedure Codes”.
- At least one of the claim detail lines with a TJR procedure code does not contain a modifier that indicates assistant, anesthesiologist, or discontinued procedure in one of the input fields *Modifier 1-4*. The configuration file lists the modifiers under “Modifiers – Assistant Surgeons, Anesthesiologists, and Discontinued Procedures”.

An associated inpatient claim must meet all of the following conditions:

- The inpatient claim has a *Header From Date Of Service* on or before the minimum *Detail From Date of Service* of the professional claim detail line(s) with the TJR procedure and also a *Discharge Date* on or after the maximum *Detail From Date of Service* of the professional claim detail line(s) with the TJR procedure.

- The inpatient claim has a TJR procedure code listed in the configuration file under “Trigger Procedure Codes” in the input fields *Surgical Procedure Code Primary* or *Surgical Procedure Code 2-24*.
- The inpatient claim does not contain a disqualifying diagnosis code in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. Disqualifying diagnosis codes are listed in the configuration file under “Trigger Disqualifying Diagnosis Codes”.

An associated outpatient claim must meet all of the following conditions:

- The outpatient claim has a minimum *Detail From Date of Service* that is within two days (i.e., as early as two days before or as late as two days after, inclusive) of the *Detail From Date of Service* of the professional claim detail line(s) with the TJR procedure.
- The outpatient claim has one of the TJR procedure codes listed in the configuration file under “Trigger Procedure Codes” in the input field *Detail Procedure Code* of one of its claim detail lines.
- At least one of the outpatient claim detail lines with a TJR procedure code does not contain a modifier for assistant surgeon and also does not contain a modifier for discontinued procedure in one of the input fields *Modifier 1-4*. The configuration file lists the modifiers under “Modifiers – Assistant Surgeons and Discontinued Procedures”.
- The outpatient claim does not have a disqualifying diagnosis code in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. Disqualifying diagnosis codes are listed in the configuration file under “Trigger Disqualifying Diagnosis Codes”.

To address cases where a professional claim is associated with more than one potential associated facility claim, the following hierarchy is used such that each professional claim is unambiguously assigned one inpatient or outpatient claim. The inpatient or outpatient claims that are lower in the hierarchy are treated like any other claims during a potential trigger, not like an associated inpatient or outpatient claim.

- An associated inpatient claim has highest priority.
- An associated outpatient claim has second priority.

Throughout the hierarchy the following rules apply:

- At each step of the hierarchy, if two or more associated inpatient claims meet the required criteria, the inpatient claim with the earliest *Header From Date Of Service* is chosen. If two or more associated inpatient claims meet the required criteria and have the same *Header From Date Of Service*, the inpatient claim belonging to the hospitalization with the latest *Discharge Date* is chosen. If the *Discharge Date* is the same, the inpatient claim with the lower *Internal Control Number* is chosen.
- At each step of the hierarchy, if two or more associated outpatient claims meet the required criteria, the claim with the earliest minimum *Detail From Date Of Service* is chosen. If two or more associated outpatient claims meet the required criteria and have the same minimum *Detail From Date Of Service*, the claim with the greater duration is chosen. The duration of a claim is defined in the glossary. If the duration is the same, the outpatient claim with the lower *Internal Control Number* is chosen.

The output field *Trigger Claim ID* is set to the input field *Internal Control Number* of the professional claim that triggered the episode. The output field *Member ID* is set to the input field *Member ID* of the professional claim that triggered the episode. The output field *Facility Trigger Claim ID* is set to the input field *Internal Control Number* of the selected associated facility claim. The output field *Facility Claim Type* is set to the input field *Claim Type* of the selected associated facility claim.

If an outpatient claim is selected to be the associated facility claim, only the outpatient claim detail line(s) that contain a TJR procedure code without an assistant surgeon or discontinued procedure modifier are eligible to be factored into the potential trigger duration logic described below.

The start date of a potential trigger is the earlier of the *Detail From Date Of Service* of the professional claim detail line(s) with the TJR procedure, the *Header From Date Of Service* of the associated hospitalization (if the professional claim is associated with a hospitalization), or the minimum *Detail From Date of Service* of the eligible claim detail line(s) of the associated outpatient claim (if the professional claim is associated with an outpatient claim). The end date of a potential trigger is the later of the *Detail To Date Of Service* of the professional claim detail line(s) with the TJR procedure, the *Discharge Date* of the hospitalization (if the professional claim is associated with a hospitalization), or the maximum *Detail To Date of Service* of the eligible claim detail line(s) of the associated outpatient claim (if the professional claim is associated with an outpatient claim).

A specific rule applies for potential triggers where the associated inpatient claim is part of a hospitalization consisting of two or more inpatient claims. For the definition of hospitalizations see the glossary. If an associated inpatient claim is part of a hospitalization consisting of two or more inpatient claims, the potential trigger starts on the earlier of the *Detail From Date Of Service* of the professional claim detail line(s) with the TJR procedure or the *Header From Date Of Service* of the chronologically first inpatient claim during the hospitalization that meets the conditions for an associated inpatient claim. The potential trigger ends on the later of the *Detail To Date Of Service* of the professional claim detail line(s) with the TJR procedure or the *Discharge Date* of the chronologically last inpatient claim (which may or may not be an associated inpatient claim) of the hospitalization. The output fields *Facility Claim ID* and *Facility Claim Type* are set using the *Internal Control Number* and *Member ID* of the earliest inpatient claim with a trigger diagnosis code during the hospitalization.

Once all potential triggers have been identified, the preliminary start and end dates for each potential trigger can be extended if they overlap with another hospitalization. In order for an extension to occur, the hospitalization must meet one of the following conditions:

- The preliminary potential trigger start and end dates both occur between the hospitalization start and end dates
- The preliminary potential trigger start date occurs between the hospitalization start date and 1 day before the hospitalization end date
- The hospitalization start date occurs between the preliminary potential trigger start date and 1 day before the preliminary potential trigger end date, and the hospitalization end date occurs after the preliminary potential trigger end date.

This extension is possible even if the trigger claim (and associated facility claim, if applicable to the episode) does not have a *Claim Type* of inpatient, as long as the trigger logic does not explicitly prohibit episodes to trigger during an inpatient stay. An overlapping hospitalization cannot result in the shortening of the preliminary potential trigger duration.

For the definition of hospitalizations see the glossary. The extension logic only applies to the first overlapping hospitalization. Additional extension is not allowed if the extended potential trigger window overlaps with another hospitalization.

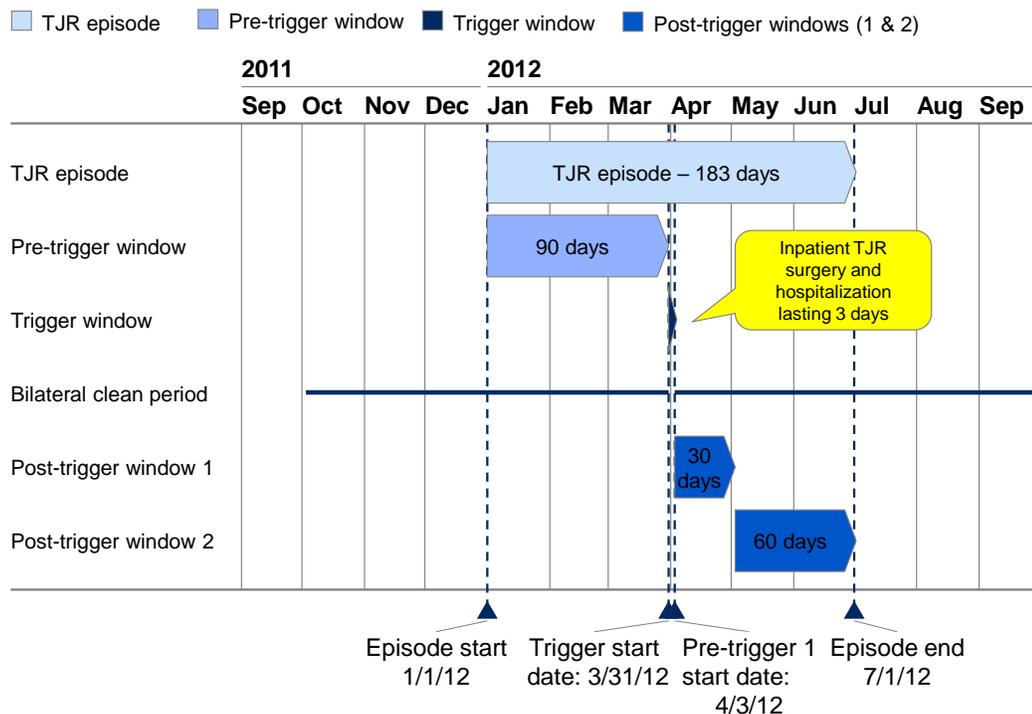

## 4.2 Determine the episode duration

The second design dimension of building a TJR episode is to define the duration of the episode and to assign claims and claim detail lines to each episode.

**Episode output fields created:** *Pre-Trigger Window Start Date, Pre-Trigger Window End Date, Trigger Window Start Date, Trigger Window End Date, Post-trigger Window 1 Start Date, Post-trigger Window 1 End Date, Post-trigger Window 2 Start Date, Post-trigger Window 2 End Date, Episode Start Date, and Episode End Date*

Four time windows are of relevance in determining the episode duration (see Exhibit 6).

EXHIBIT 6 – EPISODE DURATION

- Pre-trigger window:** The output field Pre-trigger Window Start Date is set to 90 days before the Trigger Window Start Date. The Pre-trigger Window End Date is set to the day before the Trigger Window Start Date. The output

field *Pre-trigger Window Start Date* is also the *Episode Start Date*. If a hospitalization is ongoing on the 1st day of the pre-trigger window, the *Pre-trigger Window Start Date* is set to the *Header From Date Of Service* of the hospitalization. A hospitalization is ongoing on the 1st day of the pre-trigger window if the hospitalization has a *Header From Date Of Service* before the existing pre-trigger window and a *Discharge Date* during the pre-trigger window. If more than one hospitalization is ongoing on the 1st day of the pre-trigger window, the earliest *Header From Date of Service* sets the start date of the pre-trigger window. Hospitalizations are defined in the glossary.

- **Trigger window:** The output fields *Trigger Window Start Date* and *Trigger Window End Date* are set using the potential trigger start and end dates which are defined in section 4.1. Only potential triggers that constitute an episode start can set the duration of a trigger window. The approach to determining whether a potential trigger is an episode start is described below.
- **Post-trigger window 1:** The output field *Post-trigger Window 1 Start Date*, is set to the day after the *Trigger Window End Date*. The output field *Post-trigger Window 1 End Date* is set to 30 days after the *Trigger Window End Date* or, if a hospitalization is ongoing on the 30<sup>th</sup> day of the post-trigger window 1, to the *Discharge Date* of the hospitalization. A hospitalization is ongoing on the 30<sup>th</sup> day of the post-trigger window 1 if the hospitalization has a *Header From Date Of Service* during the trigger window or the 30-day post-trigger window 1 and a *Discharge Date* beyond the 30-day post-trigger window 1. If more than one hospitalization is ongoing on the 30<sup>th</sup> day of the post-trigger window, the latest *Discharge Date* present on a hospitalization sets the end date of the post-trigger window. Hospitalizations are defined in the glossary.
- **Post-trigger window 2:** The output field *Post-trigger Window 2 Start Date* is set to the day after the end of the post-trigger window 1. The output field *Post-trigger Window 2 End Date* is set to 90 days after the *Trigger Window End Date* or, if a hospitalization is ongoing on the 90<sup>th</sup> day after the after the *Trigger Window End Date*, to the *Discharge Date* of the hospitalization. A hospitalization is ongoing on the 90<sup>th</sup> day after the *Trigger Window End Date* if the hospitalization has a *Header From Date Of Service* during the post-trigger window 2 and a *Discharge Date* beyond the 90<sup>th</sup> day after the after the *Trigger Window End Date*. If more than one hospitalization is ongoing on the 90<sup>th</sup> day after the *Trigger Window End Date*, the latest *Discharge Date* present on a hospitalization sets the end date of the post-trigger window 2.

Finally, if the post-trigger window 1 is extended beyond the 90<sup>th</sup> day after the *Trigger Window End Date*, the episode does not have a post-trigger window 2. The post-trigger window 2 generally lasts 60 days. The output field *Post-trigger Window 2 End Date* is also the *Episode End Date*. If the episode does not have a post-trigger window 2, then the *Episode End Date* is set to the output field *Post-trigger Window 1 End Date*. Hospitalizations are defined in the glossary.

- **Clean period:** For TJR episodes, the clean period starts on the potential trigger start date and extends for 180 days from the potential trigger end date. The clean period is defined as the period during which, if the potential trigger triggers an episode, no new episode can be triggered. Note that the clean period is not part of the episode duration. The episode window ends with the post-trigger window 2, as defined above.

The extension of any one episode window may not lead to further extensions of that window, i.e., if the post-trigger window 1 or 2 is extended and a claim that would be included in the episode starts in the newly added extension of the post-trigger window 1 or 2 and ends beyond it, the window in question is not extended a second time (Exhibits 7, 8, and 9).

**EXHIBIT 7 – EPISODE EXTENSIONS EXAMPLE 1**

---

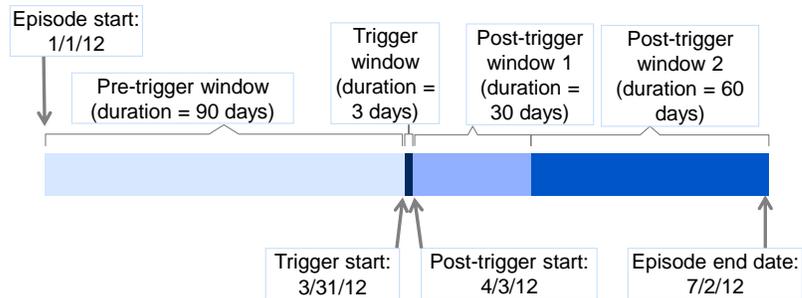

EXHIBIT 8 – EPISODE EXTENSIONS EXAMPLE 2

- Trigger window
- Pre-trigger window
- Post-trigger window 1
- Post-trigger window 2
- Hospitalization

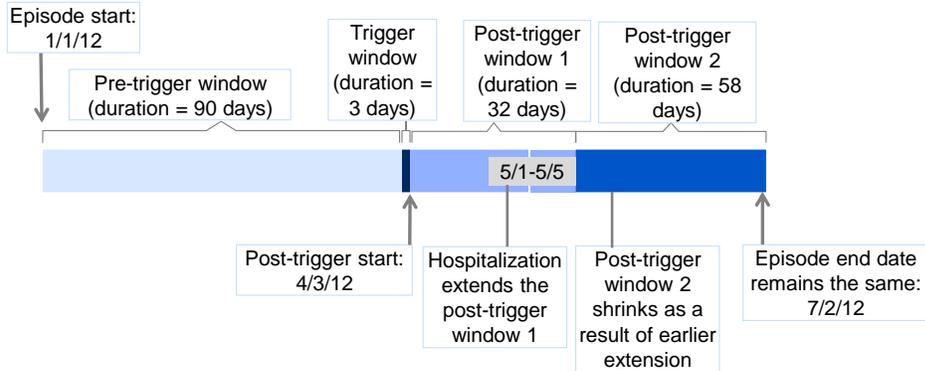

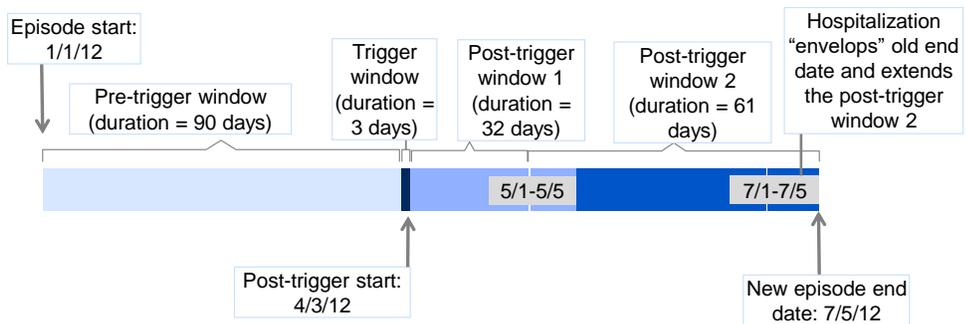

EXHIBIT 9 – EPISODE EXTENSIONS EXAMPLE 3

- Trigger window
- Pre-trigger window
- Post-trigger window 1
- Post-trigger window 2
- Hospitalization

The combined duration of the pre-trigger window, trigger window, post-trigger window 1, and post-trigger window 2 is the episode window. All time windows are inclusive of their first and last date. For a definition of how the duration of time windows is calculated see the glossary.

The logic that determines the duration of the episode window assigns potential triggers to one of two groups:

- **Trigger TJRs:** potential triggers that start a new episode and thereby define the trigger window for an episode.
- **Repeat TJRs:** potential triggers for the same patient that occur within 180 days of each other. These do not start episodes.

To overlay the episode window on the potential triggers, a chronological approach is taken. The first trigger TJR of a given patient is identified as the earliest (i.e., furthest in the past) potential trigger in the input. Once the first trigger TJR for a patient has been identified, the pre-trigger window, the trigger window, the post-trigger window 1 and the post-trigger window 2 are set. The process of setting episode windows continues for each patient until the last episode window that ends during the input data date range is defined.

As a final step, repeat TJRs are assessed. Any TJR triggers that have a trigger window start date within the 180 days before the start date of another TJR trigger or that have a start date within the 180 after the end of another TJR trigger, inclusive, are re-classified as repeat TJRs and do not start episodes. There should be no overlap between the episode windows of any of the resulting episodes. Note that the input data begins 15 months prior to the reporting window, so potential triggers may be repeat TJRs, and thus not trigger a TJR episode, due to a TJR that occurred prior to the reporting period.

The following special cases may occur when determining the episode duration:

- If two or more potential triggers have the same start date, then only one of the potential triggers is chosen as a trigger TJR. The following hierarchy is applied to identify the one potential trigger date that is assigned as a trigger TJR out of the two or more potential triggers that have the same start:
  - The potential trigger with the latest end date is selected.
  - If there is still a tie, the potential trigger with the lowest *Trigger Claim ID* is selected.

- The setting of a pre-trigger window may lead to the overlap of a pre-trigger window with the post-trigger window of a preceding episode of the same patient. In such a case, the *Pre-trigger Window Start Date* of the second episode is set to the day after the *Episode End Date* of the preceding episode.

The episode output field *Hip Indicator* marks total hip replacement episodes, defined as episodes where the TJR procedure code on the professional claim is a hip replacement procedure code that is listed in the configuration file under “Total Hip Replacement Procedure Codes”. Episodes that do not have the output field *Hip Indicator* set are total knee replacement episodes.

To determine which claims and claim detail lines occur during an episode and before an episode, the following assignment rules are used. In addition, specific rules apply to assign claims and claim detail lines to windows within the episode (the trigger window, the pre-trigger window, the post-trigger window 1, the post-trigger window 2, and hospitalizations).

- **Assignment to the episode window:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the episode window if both the *Header From Date Of Service* and the *Discharge Date* of the hospitalization occur during the episode window.
- Pharmacy claims and all their claim detail lines are assigned to the episode window if both the *Header From Date Of Service* and the *Header To Date Of Service* occur during the episode window.
- Outpatient, long-term care, and professional claims are assigned to the episode window if at least one of their claim detail lines is assigned to the episode window. Outpatient, long-term care, and professional claim detail lines are assigned to the episode window if both the *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the episode window.

- **Assignment to a window before the episode:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to a window before the episode (e.g., 365 days to 1 day before the *Episode Start Date*, 90 days to 1 day before the *Episode Start Date*) if the *Header From Date Of Service* of the hospitalization occurs during the specified time window before the *Episode Start Date*.

- Pharmacy claims and all their claim detail lines are assigned to a window before the episode if the *Header From Date Of Service* occurs during the specified time window before the *Episode Start Date*.
  - Outpatient, long-term care, and professional claims are assigned to a window before the episode if all their claim detail lines are assigned to the window before the episode. Outpatient, long-term care, and professional claim detail lines are assigned to a window before the episode if the *Detail From Date Of Service* occurs during the specified time window before the *Episode Start Date*.
- **Assignment to the trigger window:**
    - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the trigger window if both the *Header From Date Of Service* and the *Discharge Date* of the hospitalization occur during the trigger window.
    - Pharmacy claims and all their claim detail lines are assigned to the trigger window if both the *Header From Date Of Service* and the *Header To Date Of Service* occur during the trigger window.
    - Outpatient, long-term care, and professional claims are assigned to the trigger window if all of their claim detail lines are assigned to the trigger window. Outpatient, long-term care, and professional claim detail lines are assigned to the trigger window if both the *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the trigger window.
  - **Assignment to the pre-trigger window:**
    - Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the pre-trigger window if the hospitalization is assigned to the episode window and also has a *Header From Date Of Service* during the pre-trigger window.
    - Pharmacy claims and all their claim detail lines are assigned to the pre-trigger window if they are assigned to the episode window and also have a *Header From Date Of Service* during the pre-trigger window.
    - Outpatient, long-term care, and professional claims are assigned to the pre-trigger window if at least one of their claim detail lines is assigned to the pre-trigger window. Outpatient, long-term care, and professional claim detail lines are assigned to the pre-trigger window if they are

assigned to the episode window and also have a *Detail From Date Of Service* during the pre-trigger window.

■ **Assignment to the post-trigger window 1 or post-trigger window 2:**

- Hospitalizations, all inpatient claims within them, and all claim detail lines of the inpatient claims are assigned to the post-trigger window 1 or post-trigger window 2 if the hospitalization is assigned to the episode window and also has a *Discharge Date* during the post-trigger window 1 or post-trigger window 2. For hospitalizations with a *Header From Date Of Service* during the pre-trigger window and a *Discharge Date* during the post-trigger window 1 or post-trigger window 2, assignment to the pre-trigger window takes precedence.
- Pharmacy claims and all their claim detail lines are assigned to the post-trigger window 1 or post-trigger window 2 if they are assigned to the episode window and also have a *Header To Date Of Service* during the post-trigger window 1 or post-trigger window 2. For claims with a *Header From Date Of Service* during the pre-trigger window and a *Header To Date Of Service* during the post-trigger window 1 or post-trigger window 2, assignment to the pre-trigger window takes precedence.
- Outpatient, long-term care and professional claims are assigned to the post-trigger window 1 or post-trigger window 2 if at least one of their claim detail lines is assigned to the post-trigger window 1 or post-trigger window 2. Outpatient, long-term care and professional claim detail lines are assigned to the post-trigger window 1 or post-trigger window 2 if they are assigned to the episode window and also have a *Detail To Date Of Service* during the post-trigger window 1 or post-trigger window 2. If an outpatient, long-term care or professional claim has detail claims with *Detail To Date Of Service* in both post-trigger windows, then the claim is assigned to the post-trigger window 2. For claim detail lines with a *Detail From Date Of Service* during the pre-trigger window and a *Detail To Date Of Service* during the post-trigger window 1 or post-trigger window 2, assignment to the pre-trigger window takes precedence. If an outpatient or professional claim have detail claims with *Detail To Date Of Service* in both post-trigger windows, then the claim is assigned to the post-trigger window 2.

■ **Assignment to hospitalizations:**

- Pharmacy claims are assigned to a hospitalization if they are not assigned to the trigger window and both the *Header From Date Of Service* and the *Header To Date Of Service* occur during the hospitalization.
- Outpatient and professional claims are assigned to a hospitalization if they are not assigned to the trigger window and all their claim detail lines are assigned to the hospitalization. Outpatient and professional claim detail lines are assigned to a hospitalization if both the *Detail From Date Of Service* and the *Detail To Date Of Service* occur during the hospitalization.
- Long-term care claims or claim detail lines are never assigned to a hospitalization.

### 4.3 Identify claims included in episode spend

The third design dimension of building a TJR episode is to identify which claims are included in the episode for the purpose of calculating episode spend. For short, such claims or claim detail lines are referred to as included claims or included claim detail lines. Claims or claim detail lines that are excluded from the calculation of episode spend are referred to as excluded claims or excluded claim detail lines.

#### **Episode output fields created:** *Count of Included Claims*

Different rules for the inclusion of claims and claim detail lines apply to claims and claim detail lines assigned to the pre-trigger window, trigger window, post-trigger window 1 and post-trigger window 2. The assignment of claims and claim detail lines to windows during the episode is detailed in section 4.2.

- **Pre-trigger window:** Outpatient and professional claim detail lines that are assigned to the pre-trigger window but are not assigned to a hospitalization are checked for included procedures. The configuration file lists the codes under “Included Procedures”.
  - All hospitalizations that are assigned to the pre-trigger window are excluded hospitalizations. All outpatient and professional claim detail lines assigned to an excluded hospitalization are excluded claim detail lines, regardless of whether they contain included diagnosis codes.
  - If an outpatient or professional claim detail line that is assigned to the pre-trigger window and not assigned to a hospitalization contains an included

procedure code in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. For outpatient claims, all other claim detail lines on the same claim with the same *Detail from Date of Service* and *Detail to Date of Service* as the included claim detail line are also included claim detail lines.

- **Trigger window:** All inpatient claims, pharmacy claims as well as all outpatient, long-term care, and professional claim detail lines that are assigned to the trigger window are included claims.
- **Post-trigger window 1 and post-trigger window 2:** For claims and claim detail lines assigned to the post-trigger window 1 or post-trigger window 2, a hierarchy is applied to identify included claims and included claim detail lines.
  - First, included hospitalizations in the post-trigger window 1 are identified. Two approaches are used: one for hospitalizations that contain one or more header-paid (i.e., DRG-paid) inpatient claims, the other for hospitalizations that contain only detail-paid (i.e., DRG-exempt) inpatient claims. The field *Header Or Detail Indicator* is used to determine if an inpatient claim is header-paid ('H') or detail-paid ('D').
    - If a hospitalization contains one or more header-paid inpatient claims then all the header-paid inpatient claims are searched for excluded APR-DRG in the input field *APR-DRG* (see the configuration file under "Excluded APR-DRG" for the codes used). If any of the header-paid inpatient claims that are part of the hospitalization contain an excluded APR-DRG then the hospitalization is an excluded hospitalization and all inpatient claims in the hospitalization are excluded inpatient claims. If none of the header-paid inpatient claims that are part of the hospitalization contain an excluded APR-DRG then the hospitalization is an included hospitalization and all inpatient claims in the hospitalization are included inpatient claims.
    - If a hospitalization contains only detail-paid inpatient claims then all the inpatient claims are searched for included diagnoses in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* (see the configuration file under "Included Diagnoses" for the codes used). If any of the inpatient claims that are part of the hospitalization contain an included diagnosis code then the hospitalization is an included hospitalization and all inpatient claims in the hospitalization

are included inpatient claims. If none of the inpatient claims that are part of the hospitalization contain an included diagnosis code then the hospitalization is an excluded hospitalization and all inpatient claims in the hospitalization are excluded inpatient claims.

- Second, included hospitalizations in the post-trigger window 2 are identified. All the inpatient claims are searched for included diagnoses in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* (see the configuration file under “Included Diagnoses” for the codes used). If any of the inpatient claims that are part of the hospitalization contain an included diagnosis code then the hospitalization is an included hospitalization and all inpatient claims in the hospitalization are included inpatient claims. If none of the inpatient claims that are part of the hospitalization contain an included diagnosis code then the hospitalization is an excluded hospitalization and all inpatient claims in the hospitalization are excluded inpatient claims.
- Third, all pharmacy claims as well as all outpatient and professional claim detail lines assigned to a hospitalization are included or excluded based on whether the hospitalization they are assigned to is included or excluded:
  - All pharmacy claims as well as all outpatient and professional claim detail lines assigned to an excluded hospitalization are excluded claims or excluded claim detail lines, regardless of whether they contain included diagnosis, procedure, or medication codes.
  - All pharmacy claims as well as all outpatient and professional claim detail lines assigned to an included hospitalization and not assigned to an excluded hospitalization are included claims or included claim detail lines, regardless of whether they contain included diagnosis, included procedure, or included medication codes.
- Fourth, pharmacy claims as well as outpatient, long-term care and professional claim detail lines that are assigned to the post-trigger window 1 or post-trigger window 2 but are not assigned to a hospitalization are checked for included diagnoses, included procedures, and included medications. The configuration file lists the codes under “Included Diagnoses”, “Included Procedures” and “Included Medications”.
  - If an outpatient, long-term care, or professional claim that is assigned to the post-trigger window 1 or post-trigger window 2 and not assigned

to a hospitalization contains an included diagnosis code in the input field *Header Diagnosis Code Primary or Header Diagnosis Code 2-28* then all claim detail lines of the claim are included claim detail lines.

- If an outpatient, long-term care, or professional claim detail line that is assigned to the post-trigger window 1 or post-trigger window 2 and not assigned to a hospitalization contains an included procedure code in the input field *Detail Procedure Code*, then the claim detail line is an included claim detail line. For outpatient claims, all other claim detail lines on the same claim with the same *Detail from Date of Service* and *Detail to Date of Service* as the included claim detail line are also included claim detail lines.
- If a pharmacy claim that is assigned to the post-trigger window 1 or post-trigger window 2 and not assigned to a hospitalization contains an included medication code in the input field *HIC3 Code*, then the claim is an included claim. The configuration file lists included medications under “Included Medications” using Hierarchical Ingredient Code Level 3 (HIC3) identifiers provided by First Databank.
- **Episode window:** Outpatient and professional claim detail lines that are assigned to the episode window (whether they are part of an included or excluded hospitalization or not) are checked for excluded procedures. These exclusions supersede any other reason a claim detail line might be included. The configuration file lists the codes under “Excluded Transportation Procedures”.
  - If an outpatient or professional claim detail line that is assigned to the episode window contains an excluded transportation procedure code in the input field *Detail Procedure Code*, then the claim detail line is an excluded claim detail line.

The output field *Count Of Included Claims* is defined as the number of unique claims that contribute to episode spend. A claim is counted as contributing to episode spend if it is an included claim or if one or more of its claim detail lines are included claim detail lines. The output field *Count of Included Claims* is calculated overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. Breakouts by window are calculated based on the window to which each claim is assigned.

#### 4.4 Calculate non-risk-adjusted episode spend

The fourth design dimension in building a TJR episode is to calculate the non-risk-adjusted spend for each episode.

**Episode output fields created:** *Non-risk-adjusted Episode Spend, Normalized-non-risk-adjusted episode spend*

**PAP output fields created:** *Average Non-risk-adjusted PAP Spend, Total Non-risk-adjusted PAP Spend*

The *Non-risk-adjusted Episode Spend* is defined as the sum of:

- The spend for included, header-paid inpatient claims. The spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account. Ohio Medicaid has a methodology to derive this clinical component of care for relevant encounters using the relative weights for each DRG-SOI combination and hospital rates as posted on the Ohio Medicaid website (<http://medicaid.ohio.gov/PROVIDERS/FeeScheduleandRates/SchedulesandRates.aspx#1682575-inpatient-hospital-services>).
- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.
- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient, professional, and long-term care claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient, professional, and long-term care claim detail lines from FFS.

Claims from MCPs and FFS are distinguished based on the input field *FFS Or MCP Indicator*. A value of ‘E’ in the input field *FFS Or MCP Indicator* indicates an MCP claim; a value of ‘F’ indicates a FFS claim. The output field *Non-risk-adjusted Episode Spend* is calculated overall and broken out by claim

type, by window during the episode, and by claim type and window during the episode.

The *Normalized-non-risk-adjusted Episode Spend* is defined as the sum of:

- The normalized spend for included, header-paid inpatient claims. The normalized spend for each included, header-paid inpatient claim is calculated as the value in the input field *DRG Base Payment* multiplied by the ratio of the *Normalized Base Rate* to the *Base Rate* plus the values in the input fields *DRG Outlier Payment A* and *DRG Outlier Payment B*. The configuration file lists the *Normalized Base Rate* as a parameter under “Episode Spend”. The *Base Rate* is determined by looking up the appropriate value in the input field *Base Rate* from the APR-DRG Base Rate Table using the input field *Provider ID* to link to the *Billing Provider ID* of each included, header-paid inpatient claim. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’. Other components of the DRG payment are not taken into account.
- The spend for included, detail-paid inpatient claims. The spend for each included, detail-paid inpatient claim is calculated as the sum of the input fields *Detail Paid Amount* for claims from MCPs and the sum of the inputs fields *Detail Allowed Amount* for claims from FFS.
- The *Header Paid Amount* of included pharmacy claims from MCPs.
- The *Header Allowed Amount* of included pharmacy claims from FFS.
- The *Detail Paid Amount* for included outpatient, long-term care, and professional claim detail lines from MCPs.
- The *Detail Allowed Amount* for included outpatient, long-term care, and professional claim detail lines from FFS.

If a claim detail line is included for two or more reasons (e.g., due to an included diagnosis and an included procedure), its *Detail Allowed Amount* or *Detail Paid Amount* counts only once towards the *Non-risk-adjusted Episode Spend* or the *Normalized-non-risk-adjusted Episode Spend*.

For the provider reports, the fields *Average Non-risk-adjusted PAP Spend* and *Total Non-risk-adjusted PAP Spend* are added to the PAP output table. *Average Non-risk-adjusted PAP Spend* is calculated as the average of the *Non-risk-adjusted Episode Spend* across valid episodes for a given PAP. *Total Non-risk-adjusted PAP Spend* is calculated as the sum of the *Non-risk-adjusted Episode*

*Spend* across valid episodes for a given PAP. See section 4.5 for the identification of PAPs and section 4.6 for the definition of valid episodes.

The *Average Non-risk-adjusted PAP Spend* is shown overall as well as broken out by claim type, by window during the episode, and by claim type and window during the episode. The breakouts of *Average Non-risk-adjusted PAP Spend* are calculated in two ways:

- Breakout A: The averages are calculated across all valid episodes of a PAP.
- Breakout B: The averages are calculated across valid episodes of a PAP that have spend greater zero dollars (>\$0) in the category that is broken out.

For example, a PAP has 100 valid episodes and 80 of the episodes have any inpatient spend, the remaining 20 do not have any inpatient spend. To calculate breakout A for *Average Non-risk-adjusted PAP Spend Inpatient*, the denominator is 100 valid episodes. To calculate breakout B for *Average Non-risk-adjusted PAP Spend Inpatient* the denominator is 80 valid episodes with any inpatient spend.

## 4.5 Identify Principal Accountable Providers

The fifth design dimension in building a TJR episode is to assign each episode to a Principal Accountable Provider (PAP).

**Episode output field created:** *PAP ID, PAP Name, Rendering Provider ID*

**PAP output fields created:** *PAP ID, PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, PAP Zip Code*

The output field *PAP ID* is set using the input field *Billing Provider ID* on the professional claim that is used to set the *Trigger Claim ID*.

The output field *Rendering Provider ID* is set using the input field *Rendering Provider ID* of the professional claim that is used to set the *Trigger Claim ID*.

The output fields *PAP Name, PAP Address Line 1, PAP Address Line 2, PAP City, PAP State, and PAP Zip Code* are set based on the Provider Extract input fields *Provider Name, Practice Address Line 1, Practice Address Line 2, Practice City, Practice State, and Practice Zip Code*, respectively. The output fields are linked to the Provider Extract by matching the output field *PAP ID* to the input field *Provider ID* of the Provider Extract.

The output field *Rendering Provider Name* is set based on the Provider Extract input field *Provider Name*. The output field is linked to the Provider Extract by matching the output field *Rendering Provider ID* to the input field *Provider ID* of the Provider Extract.

## 4.6 Identify excluded episodes

The sixth design dimension in building a TJR episode is to identify episodes that are excluded from the episode-based payment model.

**Episode output fields created:** *Any Exclusion, Exclusion Inconsistent Enrollment, Exclusion Multiple Payers, Exclusion Third-party Liability, Exclusion Dual Eligibility, Exclusion PAP Out Of State, Exclusion No PAP, Exclusion Long Hospitalization, Exclusion Long-term Care, Exclusion Missing DRG, Exclusion Incomplete Episode, Exclusion FQHC RHC, Exclusion Age, Exclusion Left Against Medical Advice, Exclusion Death, Exclusion Comorbidity, Exclusion Multiple Other Comorbidities, Exclusion High Outlier*

Each *Exclusion <name of exclusion>* output field indicates whether an episode is excluded for a given reason and therefore invalid for the purpose of the episode based payment model. If an episode is excluded for more than one reason each exclusion is indicated. The output field *Any Exclusion* indicates whether an episode contains any exclusion. Episodes may be excluded for business reasons, for clinical reasons, or because they are outliers. After all exclusions have been applied, a set of valid episodes remains.

### Business exclusions

- **Inconsistent enrollment:** An episode is excluded if the patient was not continuously enrolled in Ohio Medicaid during the episode window. Enrollment is verified using the *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the *Aid Category* indicates full Medicaid enrollment. *Aid Category* codes that indicate full Medicaid enrollment are listed in the configuration file under “Business Exclusions – Inconsistent Enrollment”. Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered continuously enrolled if the patient’s *Eligibility Start Date* for full Medicaid falls before or on ( $\leq$ ) the *Episode Start Date* and the *Eligibility End Date* for full Medicaid falls on or after ( $\geq$ ) the *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID*

from the Member Extract to identify the enrollment information for each patient.

A patient may have multiple entries for *Eligibility Start Date* and *Eligibility End Date* for full Medicaid and some of the dates may be overlapping. In such cases, continuous, non-overlapping records of a patient's enrollment are created before confirming whether the patient was continuously enrolled during an episode. If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for full Medicaid, enrollment is considered to be ongoing through the last date of the input data.

If a patient was not continuously enrolled in Ohio Medicaid before or after the episode window, but was continuously enrolled during the episode window, the episode is not excluded.

- **Multiple payers:** An episode is excluded if a patient changes enrollment between MCPs during the trigger window or during the post-trigger window(s) (if applicable). Episodes are identified as having multiple payers if there is an inpatient, outpatient, professional, or pharmacy claim that meets all of the following conditions:
  - The claim is assigned to the trigger window or the post-trigger window of the episode (if applicable)
  - The input field *FFS Or MCP Indicator* of the claim is not "FFS"
  - The input field *MCP ID* on the claim is not null and does not belong to the same payer that the episode is attributed to. Since a payer may be associated with multiple MCP IDs, the input field *MCP ID* must be crosswalked to a payer name. An updated crosswalk including current and historical MCP IDs must be used for each reporting period

If a patient changes enrollment between MCPs during the pre-trigger window (if any) or before the episode window, it is the responsibility of the payer to whom the episode is attributed to utilize the claims history of the patient with the prior payer to build the episode. Attribution of an episode to a payer is defined in the glossary under "Payer Attribution."

- **Third-party liability:** An episode is excluded if either:
  - An inpatient, outpatient, or professional claim that is assigned to the episode window is associated with a third-party liability amount. A claim is considered to be associated with a third-party liability amount if either the input field *Header TPL Amount* or any of the input fields *Detail TPL*

*Amount* have a value greater than (>) zero. The claim with a positive TPL amount may or may not be included in the calculation of episode spend.

- As an exception, a third party liability amount in the input field *Header TPL Amount* or the input field *Detail TPL Amount* of a professional FFS claim from an FQHC or RHC does not lead to exclusion of the episode if the episode is attributed to an MCP. Professional claims from FQHC or RHC are identified based on one or more detail lines that are assigned to the episode window and also have a *Place Of Service* of FQHC or RHC. The relevant values for *Place Of Service* are listed in the configuration file under “Business Exclusions – TPL Exempt Places of Service”. Claims from FFS are identified based on the input field *FFS Or MCP Indicator* having a value of ‘F’. Attribution of an episode to a payer is defined in the glossary under “Payer attribution”.
- A patient was enrolled with a relevant source of third party liability during the episode window. Enrollment is verified using the *TPL Effective Date* and *TPL End Date* from the Member Extract where the *Coverage Type* indicates relevant TPL coverage. *Coverage Type* codes that indicate relevant TPL are listed in the configuration file under “Business Exclusions – TPL Relevant Coverage”.

A patient is considered enrolled with a relevant source of TPL if the patient’s *TPL Effective Date* falls before or on ( $\leq$ ) the *Episode End Date* and the *TPL End Date* falls on or after ( $\geq$ ) the *Episode Start Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the enrollment information for each patient.

If a patient has a *TPL Effective Date* without a corresponding *TPL End Date* the enrollment with a relevant source of TPL is considered to be ongoing through the last date of the input data.

If a patient was enrolled with a relevant TPL source before or after the episode window, but was not enrolled during the episode window, the episode is not excluded.

- **Dual eligibility:** An episode is excluded if the patient had dual coverage by Medicare and Medicaid during the episode window. Dual coverage is determined using the *Eligibility Start Date* and *Eligibility End Date* from the Member Extract where the *Aid Category* indicates dual coverage. *Aid Category* codes that indicate dual coverage are listed in the configuration file

under “Business Exclusions – Duals”. Note that only the first digit of the *Aid Category* code is used for this purpose.

A patient is considered to have dual coverage during the episode window if the patient’s *Eligibility Start Date* for dual coverage falls before or on ( $\leq$ ) the *Episode End Date* and the *Eligibility End Date* for dual coverage falls on or after ( $\geq$ ) the *Episode Start Date*. The input field *Member ID* is linked to the output field *Member ID* from the Eligibility Extract to identify the enrollment information for each patient.

If a patient has an *Eligibility Start Date* without a corresponding *Eligibility End Date* for dual coverage, the dual coverage is considered to be ongoing through the last date of the input data.

If a patient had dual coverage prior to or after the episode window, but not during the episode window, the episode is not excluded.

- **PAP out of state:** An episode is excluded if the PAP has a practice address outside of Ohio. The state of the practice address is determined using the output field *PAP State* and the state code for Ohio is listed in the configuration file under “Business Exclusions – PAP Out Of State”.
- **No PAP:** An episode is excluded if the PAP cannot be identified. A PAP cannot be identified if the *Billing Provider ID* is not available.
- **Long hospitalization:** An episode is excluded if a hospitalization that is assigned to the episode window has a duration greater than ( $>$ ) 30 days. The hospitalization may or may not be included in the episode spend.
- **Long-term care:** An episode is excluded if the patient has one or more long-term care claim detail lines which overlap the pre-trigger or trigger windows, unless that claim starts on the last day of the trigger window. A long-term care claim detail line which overlaps the pre-trigger or trigger window, but does not start on the last day of the trigger window is defined as one with both a *Detail From Date Of Service* prior to ( $<$ ) the *Trigger End Date* and a *Detail To Date Of Service* on or after ( $\geq$ ) the *Episode Start Date*. The long-term care claim may or may not be included in the episode spend.
- **Missing DRG:** An episode is excluded if a header-paid inpatient claim assigned to the episode window has an invalid or missing value in the input fields *APR-DRG* or *Severity Of Illness*. Header-paid inpatient claims are identified based on a *Header Or Detail Indicator* of ‘H’.

- **Incomplete episodes:** An episode is excluded if the *Non-risk-adjusted Episode Spend* (not the *Risk-adjusted Episode Spend*) is less than (<) the incomplete episode threshold. The incomplete episode threshold is listed as a parameter in the configuration file under “Excluded Episodes”.
- **FQHC/RHC:** An episode is excluded if the PAP is classified as a federally qualified health center or rural health clinic. A PAP is determined to be a FQHC or RHC if the input field *Billing Provider Type* of the PAP is listed in the configuration file under “Business Exclusions – FQHC and RHC.”

### Clinical exclusions

- **Age:** An episode is excluded if the output field *Member Age* does not fall into the valid age range or if it is invalid. See the glossary for the definition of *Member Age*. The valid age range for the TJR episode is listed as parameter in the configuration file under “Excluded Episodes”.
- **Left against medical advice:** An episode is excluded if the patient has a *Patient Status Indicator* of “Left Against Medical Advice or Discontinued Care” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The value of *Patient Status Indicator* used to identify whether the patient left against medical advice is listed in the configuration file under “Clinical exclusions – Left Against Medical Advice”.
- **Death:** An episode is excluded if either:
  - The patient has a *Patient Status Indicator* of “Expired” on any inpatient or outpatient claim assigned to the episode window. The claim may be an included claim or not. The values for the *Patient Status Indicator* used to identify whether the patient expired are listed in the configuration file under “Clinical Exclusions – Death”.
  - The input field *Date Of Death* in the Member Extract contains a date prior or equal to the *Episode End Date*. The output field *Member ID* is linked to the input field *Member ID* from the Member Extract to identify the *Date Of Death* for each patient.
- **Comorbidity:** An episode is excluded if the patient has one of more comorbidity codes during a specified time window. The following approaches are used to identify comorbidities:

- Comorbidity diagnosis codes are searched in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* of inpatient, outpatient, and professional claims that are assigned to the specified time windows. The configuration file lists the codes and time windows under “Comorbidities Diagnoses- <name of comorbidity>”.

The claims and claim detail lines that are searched for comorbidities do not have to be included claims or included claim detail lines. If a patient lacked continuous eligibility during the year prior to the episode or during the episode window, comorbidities are checked in the data available.

## Outliers

- **High outlier:** An episode is excluded if the *Risk-adjusted Episode Spend* (not the *Non-risk-adjusted Episode Spend*) is above (>) the high outlier threshold. The high outlier thresholds for the TJR episode is listed as a parameter in the configuration file under “Excluded Episodes”. See section 4.8 for the definition of *Risk-adjusted Episode Spend*.

## 4.7 Identify Principal Accountable Providers who pass the quality metrics

The seventh design dimension in building a TJR episode is the calculation of the quality metrics and the identification of PAPs who pass the quality metrics performance requirement.

**Episode output fields created:** *Quality Metric 1 Indicator, Quality Metric 2 Indicator, Quality Metric 3 Indicator, Quality Metric 4 Indicator*

**PAP output fields created:** *PAP Quality Metric 1 Performance, PAP Quality Metric 2 Performance, PAP Quality Metric 3 Performance, PAP Quality Metric 4 Performance*

The TJR episode has two quality metrics that are tied to gain sharing and two informational (i.e. not tied to gain sharing) quality metrics.

- **Quality metric 1: 30-day hospitalization rate (except Acute Rehab)**
  - The *Quality Metric 1 Indicator* marks episodes with an included hospitalization that is assigned to the post-trigger window 1 and that is also not an acute rehabilitation hospitalization. Acute rehabilitation hospitalizations are identified as:

- A hospitalization in which at least one an inpatient claim has a rehabilitation diagnosis code in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28* or a rehabilitation revenue code in the input field *Detail Revenue Code*. The configuration file lists the diagnosis codes for rehabilitation under “Quality Metric 01 – Rehabilitation Diagnoses” and the revenue codes under “Quality Metric 01 – Rehabilitation Revenue Codes”.
- The *PAP Quality Metric 1 Performance* is expressed as a percentage for each PAP based on the following ratio:
  - Numerator: Number of valid episodes of the PAP with a hospitalization
  - Denominator: Number of valid episodes of the PAP
- **Quality metric 2: Fractures, dislocations, and wound infections rate**
  - The *Quality Metric 2 Indicator* marks episodes where the patient suffers from one or more fractures, dislocations, or wound infections during post-trigger window 1 or post-trigger window 2. A fracture, dislocation or wound infection is identified as one of more of the following occurring:
    - An outpatient, long-term care or professional claim that is assigned to the post-trigger window 1 or post-trigger window 2 and also has a diagnosis code for a fracture, dislocation, or wound infection in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The configuration file lists the diagnosis codes for fractures, dislocations and open wounds under “Quality Metric 02 – Fractures, Dislocations, And Wound Infections Diagnoses”.
    - An outpatient, long-term care or professional claim detail line that is assigned to the post-trigger window 1 or post-trigger window 2 and also has a CPT procedure code for a fracture, dislocation, or wound infection in the input field *Detail Procedure Code*. The configuration file lists the CPT codes for fractures, dislocations and open wounds under “Quality Metric 02 – Fractures, Dislocations, And Wound Infections Procedures”.
  - The *PAP Quality Metric 2 Performance* is expressed as a percentage for each PAP based on the following ratio:
    - Numerator: Number of valid episodes of the PAP with one or more fractures, dislocations, or wound infections during post-trigger windows 1 or 2.

- Denominator: Number of valid episodes of the PAP

### ■ **Quality metric 3: Pulmonary embolism rate**

- The *Quality Metric 3 Indicator* marks episodes where the patient suffers a pulmonary embolism in the trigger window, post-trigger window 1 or post-trigger window 2. A pulmonary embolism is identified as an inpatient, outpatient, long-term care or professional claim that is assigned to the trigger window, post-trigger window 1 or post-trigger window 2 and also has a diagnosis code for pulmonary embolism in the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The configuration file lists the diagnosis codes for pulmonary embolisms under “Quality Metric 03 – Pulmonary Embolism Diagnoses”.
- The *PAP Quality Metric 3 Performance* is expressed as a percentage for each PAP based on the following ratio:
  - Numerator: Number of valid episodes of the PAP with a pulmonary embolism in the trigger window or post-trigger windows 1 or 2.
  - Denominator: Number of valid episodes of the PAP

### ■ **Quality metric 4: Blood transfusion rate**

- The *Quality Metric 4 Indicator* marks episodes where the patient receives a blood transfusion during the trigger window. A blood transfusion is identified as one or more of the following:
  - An inpatient claim that is assigned to the trigger window and also has an ICD-9 or ICD-10 procedure code for blood transfusion in the input fields *Surgical Procedure Code Primary* or *Surgical Procedure Code 2-24*. The configuration file lists the ICD-9 and ICD-10 procedure codes for blood transfusion under “Quality Metric 04 – Transfusions Procedures”.
  - An inpatient or outpatient claim detail line that is assigned to the trigger window and also has a revenue code for blood transfusion in the input field *Detail Revenue Code*. The configuration file lists the revenue codes for blood transfusion under “Quality Metric 04 – Transfusions Revenue Codes”.
  - An outpatient or professional claim detail line that is assigned to the trigger window and also has a CPT procedure code for blood transfusion in the input field *Detail Procedure Code*. The configuration

file lists the CPT codes for blood transfusion under “Quality Metric 04 – Transfusions Procedures”.

- The *PAP Quality Metric 4 Performance* is expressed as a percentage for each PAP based on the following ratio:
  - Numerator: Number of valid episodes of the PAP with one or more blood transfusions during the trigger window
  - Denominator: Number of valid episodes of the PAP

#### 4.8 Perform risk adjustment

The eighth design dimension of building a TJR episode is to risk adjust the non-risk-adjusted episode spend for risk factors that may contribute to higher episode spend given the characteristics of a patient.

**Episode output fields created:** *Risk Factor <risk factor number>, Episode Risk Score, Risk-adjusted Episode Spend*

**PAP output fields created:** *Average Risk-adjusted PAP Spend, Total Risk-adjusted PAP Spend*

Risk adjustment first requires identification of the risk factors that affect each episode. Then the *Non-risk-adjusted Episode Spend* is multiplied by the risk score that applies to the episode given its risk factors. The derivation of the risk factors and their coefficients is not part of the algorithm to produce an episode and is therefore not described in the DBR.

**Flag episodes that are affected by risk factors:** The following types of risk factors apply:

- Diagnosis-based risk factors: The output fields *Risk Factor <risk factor number>* for diagnosis-based risk factors indicate whether an inpatient, outpatient, or professional claim that is assigned to the specified time window contains a risk factor diagnosis code in any of the input fields *Header Diagnosis Code Primary* or *Header Diagnosis Code 2-28*. The risk factor diagnosis codes and the time windows are listed in the configuration file under “Risk Factor <risk factor number and name> – Diagnoses”.

The claims that are searched for risk factors do not have to be included claims. If a patient was not continuously enrolled during the year before the episode

window or during the episode window, risk factors are searched in the claims available.

**Calculate the episode risk score:** Each risk factor is associated with a risk coefficient, the values for which are listed as parameters in the configuration file under “Risk Adjustment”. The sum of all the risk coefficients for factors present in a given episode plus the *Average Risk Neutral Episode Spend* is the predicted spend of the episode. The configuration file lists the *Average Risk Neutral Episode Spend* as a parameter under “Risk Adjustment”. For the TJR episode, the *Episode Risk Score* for an episode is the ratio of the *Average Risk Neutral Episode Spend* to the predicted spend of the episode. For example, if an episode is affected by two risk factors, *Risk Factor 001* and *Risk Factor 002*, the *Episode Risk Score* is:

$$\text{Episode Risk Score} = \frac{\text{Average Risk Neutral Episode Spend}}{\text{Average Risk Neutral Episode Spend} + \text{Risk Coefficient 001} + \text{Risk Coefficient 002}}$$

If an episode is not affected by any risk factors, the *Episode Risk Score* is equal to one (1).

**Calculate risk-adjusted episode spend:** To calculate the episode output field *Risk-adjusted Episode Spend*, the *Non-risk-adjusted Episode Spend* is multiplied by the *Episode Risk Score*.

$$\text{Risk-adjusted Episode Spend} = \text{Non-risk-adjusted Episode Spend} * \text{Episode Risk Score}$$

The PAP output field *Average Risk-adjusted PAP Spend* is calculated as the average of the *Risk-adjusted Episode Spend* across valid episodes of each PAP. The *Total Risk-adjusted PAP Spend* is calculated as the sum of the *Risk-adjusted Episode Spend* across valid episodes of each PAP.

#### 4.9 Calculate gain/risk sharing amounts

The ninth and final design dimension of building the TJR episode is to calculate the gain or risk sharing amount for each PAP. The description below outlines one possible approach of linking PAP performance to payments. The

State of Ohio may choose to provide further guidance at a future point in time when gain/risk sharing payments will be implemented.

**PAP output fields created:** *Count Of Total Episodes Per PAP, Count Of Valid Episodes Per PAP, Minimum Episode Volume Pass, Gain Sharing Quality Metric Pass, Gain/Risk Sharing Amount, PAP Sharing Level*

Gain and risk sharing amounts are calculated based on the episodes of each PAP that end during the reporting period. The State's proposed approach to calculating the gain or risk sharing amount paid to/by each PAP uses the following pieces of information:

- **Number of episodes of each PAP:** The output field *Count Of Total Episodes Per PAP* is defined as the number of total episodes each PAP treats during the reporting period. The output field *Count Of Valid Episodes Per PAP* is defined as the number of valid episodes each PAP treats during the reporting period. Episodes are counted separately by each payer. For the provider reports the field *Count Of Valid Episodes Per PAP* is also shown broken out by the number of valid episodes with spend of each claim type (*Count Of Valid Episodes Per PAP With Inpatient/With Outpatient/With Professional/With Pharmacy*). To calculate the breakouts, the number of valid episodes of each PAP are counted that have greater than zero dollars (>\$0) in *Non-risk-adjusted Episode Spend* for a given claim type.
- **Minimum episode requirement:** Only PAPs who pass the minimum episode requirement of five or more ( $\geq 5$ ) valid episodes receive a provider report and are eligible for gain and risk sharing. The output field *Minimum Episode Volume Pass* is set to indicate whether a PAP has five or more valid episodes during the reporting period. Whether a PAP passes the minimum episode requirement is determined independently by each payer based on the episodes a PAP has for patients enrolled with the payer. The assignment of episodes to a payer is detailed in the glossary under payer attribution.
- **Performance of each PAP on quality metrics tied to gain sharing:** Only PAPs who pass the quality metrics tied to gain sharing are eligible for gain sharing. The thresholds to pass the quality metrics are set in accordance with the definition of each quality metric and are provided as input parameters for the episode algorithm. The output field *Gain Sharing Quality Metric Pass* indicates whether a PAP passes all quality metrics tied to gain sharing.
- **Commendable Threshold, Acceptable Threshold, and Gain Sharing Limit Threshold:** The thresholds are set based on the historical performance of

PAPs with five or more episodes. The values for the thresholds are provided as input parameters for the episode algorithm.

- *Gain Share Proportion* and *Risk Share Proportion*: The split of the gains and losses in the episode-based payment model between payer and provider is at the discretion of each payer. The proportions are provided as input parameters for the episode algorithm.

**Gain sharing payment:** To receive a gain sharing payment, a PAP must meet all of the following three criteria:

- Pass the quality metrics thresholds tied to gain sharing
- Pass the minimum episode requirement,
- Have an *Average Risk-adjusted PAP Spend* below (<) the *Commendable Threshold*.

If the three conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$[Gain/Risk Sharing Amount] = [Total Non-risk-adjusted PAP Spend] \times [Gain Share Proportion] \times \left( \frac{[Commendable Threshold] - [Average Risk-adjusted PAP Spend]}{[Average Risk-adjusted PAP Spend]} \right)$$

**Risk sharing payment:** To owe a risk-sharing payment, a PAP must meet both of the following criteria:

- Pass the minimum episode requirement
- Have an *Average Risk-adjusted PAP Spend* above (>) the *Acceptable Threshold*.

The risk-sharing payment applies irrespective of the performance of the PAP on the quality metrics. If the above two conditions are met, the *Gain/Risk Sharing Amount* is set based on the following formula:

$$[Gain/Risk Sharing Amount] = [Total Non-risk-adjusted PAP Spend] \times [Risk Share Proportion] \times \left( \frac{[Acceptable Threshold] - [Average Risk-adjusted PAP Spend]}{[Average Risk-adjusted PAP Spend]} \right)$$

If neither the conditions for a gain sharing payment nor a risk sharing payment are met, the output field *Gain/Risk Sharing Amount* is set to zero dollars ('\$0').

To summarize the performance of each PAP in the episode-based payment model the output field *PAP Sharing Level* is set to

- “1” if *Average Risk-adjusted PAP Spend* < *Gain Sharing Limit Threshold*
- “2” if *Average Risk-adjusted PAP Spend* < *Commendable Threshold* and also  $\geq$  *Gain Sharing Limit Threshold*
- “3” if *Average Risk-adjusted PAP Spend*  $\leq$  *Acceptable Threshold* and also  $\geq$  *Commendable Threshold*
- “4” if *Average Risk-adjusted PAP Spend* > *Acceptable Threshold*

\*\*\* End of algorithm \*\*\*

## 5. GLOSSARY

- **Claim types:** The claim types used in the TJR episode are based on the input field *Claim Type*. The required claim types are:
  - Inpatient (I)
  - Long-term care (L)
  - Outpatient (O)
  - Pharmacy (P and Q)
  - Professional (M)

Note that the State of Ohio Department of Medicaid defines long-term care claims based on the input field *Type of Bill* values beginning with 21, 22, 23, 28, 65, and 66.

- **CPT:** Current Procedural Terminology
- **DBR:** Detailed Business Requirements
- **Duration of time windows:** The duration of a time window (e.g., the episode window, the trigger window, post-trigger window), the duration of a claim or claim detail line, and the length of stay for inpatient stays is calculated as the last date minus the first date plus one (1). For example:
  - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 1, 2014 has a duration of one (1) day.
  - A trigger window with a *Trigger Window Start Date* of January 1, 2014 and a *Trigger Window End Date* of January 3, 2014 has a duration of three (3) days.
  - A claim with a *Header From Date of Service* of January 1, 2014 and a *Header To Date of Service* of January 2, 2014 has a duration of two (2) days.
- **Episode window:** See section 4.2.
- **FFS:** Fee For Service
- **HCPCS:** Healthcare Common Procedure Coding System
- **HIC3:** Hierarchical Ingredient Code at the third level based on the classification system by First Databank

- **Hospitalization:** A hospitalization is defined as all the inpatient claims a patient incurs while being continuously hospitalized in one or more inpatient facilities. A hospitalization may include more than one inpatient claim because the inpatient facility may file interim inpatient claims and/or because the patient may be transferred between two or more inpatient facilities. A hospitalization consisting of just one inpatient claim starts on the *Header From Date Of Service* and ends on the *Discharge Date* of the inpatient claim. A hospitalization where two or more inpatient claims are linked together starts on the *Header From Date Of Service* of the first inpatient claim and ends on the *Discharge Date* of the last inpatient claim in the hospitalization. Within the DBR, the start of a hospitalization is referred to as the *Header From Date Of Service* for that hospitalization and the end of the hospitalization is referred to as the *Discharge Date* of that hospitalization.

Inpatient claims are linked together into one hospitalization consisting of two or more inpatient claims if any of the following conditions apply:

- Interim billing or reserved/missing discharge status: An inpatient claim with a *Patient Status Indicator* that indicates interim billing (see the configuration file under “Hospitalization – Interim Billing” for the codes used), that is reserved (see the configuration file under “Hospitalization – Reserved” for the codes used), or that is missing is linked with a second inpatient claim into one hospitalization if either of the following conditions apply:
  - There is a second inpatient claim with a *Header From Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim
  - There is a second inpatient claim with an *Admission Date* on the same day as the *Admit Date* of the first inpatient claim and also a *Header From Date Of Service* on the same day as or within thirty ( $\leq 30$ ) days after the *Discharge Date* of the first inpatient claim. If the *Discharge Date* of the first inpatient claim is not populated, then use the *Header To Date of Service* of the first inpatient claim
- Transfer: An inpatient claim with a *Patient Status Indicator* indicating a transfer (see the configuration file under “Hospitalization – transfer” for the codes used) is linked with a second inpatient claim into one hospitalization if there is a second inpatient claim with a *Header From*

*Date Of Service* on the same day as or the day after the *Discharge Date* of the first inpatient claim.

- If the second inpatient claim (and potentially third, fourth, etc.) also has a *Patient Status Indicator* indicating interim billing, reserved, missing, or transfer the hospitalization is extended further until an inpatient claim with a discharge status other than interim billing, reserved, missing, or transfer occurs, or until the inpatient claim that follows does not satisfy the required conditions.

- **ICD-9:** International Classification of Diseases, Ninth Revision
- **ICD-10:** International Classification of Diseases, Tenth Revision
- **ICN:** Internal Control Number
- **Invalid episodes:** See section 4.6
- **Length of stay:** See glossary entry Duration of time windows.
- **MCP:** Managed Care Plan
- **Member Age:** The output field *Member Age* reflects the patient’s age in years at the start of the trigger window. *Member Age* is calculated as the difference in years between the start of the claim that is used to set the *Trigger Claim ID* and the date of birth of the patient. The start of the claim is determined using the input field *Header From Date Of Service* for inpatient claims and the earliest *Detail From Date Of Service* across all claim detail lines for outpatient and professional claims. The date of birth of the patient is identified by linking the *Member ID* of the patient in the episode output table to the Member ID of the patient in the Member Extract and looking up the date in the input field *Date of Birth*. *Member Age* is always rounded down to the full year. For example, if a patient is 20 years and 11-months old at the start of the episode, the *Member Age* is set to 20 years. If the *Date of Birth* is missing, invalid, greater than (>) 100 years, or less than (<) 0 years, then the output field *Member Age* is treated as invalid.
- **NDC:** National Drug Code
- **PAP:** Principal Accountable Provider
- **Patient:** An individual with a TJR episode.
- **Payer attribution:** Patients may be enrolled with Ohio Medicaid Fee For Service or with a Managed Care Plan. An episode is assigned to the payer

that paid for the claim that is used to set the *Trigger Claim ID*. The payer that paid for a claim is identified using the input data field *MCP ID*.

- **Pre-trigger window:** See section 4.2
- **Post-trigger window:** See section 4.2
- **TJR:** Total joint replacement
- **Total episodes:** All episodes, valid plus invalid.
- **Trigger window:** See section 4.2
- **Valid episodes:** See section 4.6
